Arizona's College and Career Ready Standards - Mathematics - Kindergarten Standards Placemat

Representing and comparing whole numbers initially with sets of objects

- Students use numbers, including written numerals, to represent quantities and to solve quantitative problems, such as counting objects in a set; counting out a given number of objects; comparing sets or numerals; and modeling simple joining and separating situations with sets of objects, or eventually with equations such as $5+2=7$ and $7-$ $2=5$. (Kindergarten students should see addition and subtraction equations, and student writing of equations in kindergarten is encouraged, but it is no required.) Students choose, combine, and apply effective strategies for answering quantitative questions, including quickly recognizing the cardinalities of small sets of objects, counting and producing sets of given sizes, counting the number of objects in combined sets, or counting the number of objects that remain in a set after some are taken away.

## 2. Describing shapes and space

- Students describe their physical world using geometric ideas (e.g., shape, orientation, spatial relations) and vocabulary. They identify, name, and describe basic two-dimensional shapes, such as squares, triangles, circles, rectangles, and hexagons, presented in a variety of ways (e.g., with different sizes and orientations), as well as threedimensional shapes such as cubes, cones, cylinder and spheres. They use basic shapes and spatial easoning to model objects in their environment and to construct more complex shapes

## Counting and Cardinality

## Know number names and the count sequence

K.CC.A.1: Count to 100 by ones and by tens.
K.CC.A.2: Count forward beginning from a given number within the known sequence (instead of having to begin at 1).
K.CC.A.3: Write numbers from 0 to 20. Represent a number of objects with a written numeral 0-20 (with 0 representing a count of no objects).

Counting to tell the number of objects.
K.CC.B.4: Understand the relationship between numbers and quantities; connect counting to cardinality.
a. When counting objects, say the number names in the standard order, pairing each object with one and only one number name and each number name with one and only one object
b. Understand that the last number name said tells the number of objects counted. The number of objects is the same regardless of their arrangement or the order in which they were counted
c. Understand that each successive number name refers to a quantity that is one larger.
K.CC.B.5: Count to answer "how many?" questions about as many as 20 things arranged in a line, a rectangular array, or a circle, or as many as 10 things in a scattered configuration; given a number from 1-20 count out that many objects.

## Comparing numbers.

K.CC.C..6: Identify whether the number of objects in one group is greater than, less than, or equal to the number of objects in another group, e.g., by using matching and counting strategies. (Note: Include groups with up to ten objects.
K.CC.C.7: Compare two numbers between 1 and 10 presented as written numerals.

## Operations and Algebraic Thinking

Understanding addition as putting together and adding to, and understanding subtraction as taking apart and taking from.
K.OA.A.1:Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations. (Note: Drawings need not show details, but should show the mathematics in the problem -- this applies wherever drawings are mentioned in the Standards.)
K.OA.A.2: Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem
K.OA.A.3: Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using
objects or drawings, and record each decomposition by a drawing or equation (e.g., $5=2+3$ and $5=4$ 1).
K.OA.A.4: For any number from 1 to 9 , find the number tha makes 10 when added to the given number, e.g., by using objects or drawings, and record the answe with a drawing or equation.

## K.OA.A.5: $\quad$ Fluently add and subtract within 5

## Number and Operations in Base Ten

Norking with numbers 11-19 to gain foundations for place value.
K.NBT.A.1: Compose and decompose numbers from 11 to 19 into ten ones and some further ones, e.g., by using objects or drawings, and record each composition or decomposition by a drawing or equation (e.g., $18=10+8$ ); understand that these numbers are composed of ten ones and one, two three, four, five, six, seven, eight, or nine ones

## Measurement and Data

## Describe and compare measurable attributes

K.MD.A.1: Describe measurable attributes of objects, such as length or weight. Describe several measurable attributes of a single object
K.MD.A.2: Directly compare two objects with a measurable attribute in common, to see which object has "mor of" "less of" the attribute, and describe the difference. For example, directly compare the heights of two children and describe one child as taller/shorter.
Classify objects and count the number of objects in each category.
K.MD.B.3: Classify objects or people into given categories; count the numbers in each category and sort the categories by count. (Note: Limit category counts to be less than or equal to 10 .)

## Geometry

dentify and describe shapes (squares, circles, triangles, ectangles, hexagons, cubes, cones, cylinders, and

## pheres)

K.G.A.1: Describe objects in the environment using names of shapes, and describe the relative positions of these objects using terms such as above, below, beside, in front of, behind, and next to
K.G.A.2: Correctly name shapes regardless of thei orientations or overall size.
K.G.A.3: Identify shapes as two-dimensional (lying in a plane, "flat") or three-dimensional ("solid"),
Analyze, compare, create, and compose shapes
K.G.B.4: Analyze and compare two- and three-dimensional shapes, in different sizes and orientations, using informal language to describe their similarities differences, parts (e.g., number of sides and vertices/"corners") and other attributes (e.g., having sides of equal length)
K.G.B.5: Model shapes in the world by building shapes from components (e.g., sticks and clay balls) and drawing shapes.
K.G.B.6: Compose simple shapes to form larger shapes. For example, "Can you join these two triangles with full sides touching to make a rectangle?"

## Mathematical Practices

. Make sense of problems and persevere in solving them
2. Reason abstractly and quantitatively.
. Construct viable arguments and critique the reasoning of others.
. Model with mathematics
. Use appropriate tools strategically.
. Attend to precision.
. Look for and make use of structure
. Look for and express regularity in repeated reasoning

## Arizona's College and Career Ready Standards - Mathematics - 1st $^{\text {st }}$ Grade Standards Placemat

. Developing understanding of addition, subtraction, and strategies for addition and subtraction within 20

- Students develop strategies for adding and subtracting whole numbers based on their prior work with small numbers. They use a variety of models, including discrete objects and length-based models (e.g., cubes connected to orm lengths), to model add-to, take-from, put-together, ake-apart, and compare situations to develop meaning for he operations of addition and subtraction, and to develop strategies to solve arithmetic problems with these operations. Students understand connections between couning and addilin and subtracion (e.g., adding wo addition to add whole numbers and to create and use increasingly sophisticated strategies based on these properties (e "making tens") to solve addition and btraction problems within 20 By comparing a variety solution strategies, children build their understanding of the elationship between addition and subtraction.

2. Developing understanding of whole number relationship and place value, including grouping in tens and ones - Students develop, discuss, and use efficient, accurate, and generalizable methods to add within 100 and subtract muliples of 0 . The compare whole numbers (at least to 00) to develop understanding of and solve problems保 wring he 11 to 10 a colosed oge ones) Through activitios that build number sense ey understand the order of the counting numbers and their rder of the counting numbers and their relative magnitudes.
. Developing understanding of linear measurement and
measuring lengths as iterating length units

- Students develop an understanding of the meaning and processes of measurement, including underlying concepts such as iterating (the mental activity of building up the length of an object with equal-sized units) and the transitivity principle for indirect measurement. (Note: students should apply the principle of transitivity of measurement to make rect comparisons, but they need not use this technica erm.)

4. Reasoning about attributes of, and composing and decomposing geometric shapes

- Students compose and decompose plane or solid figures (e.g., put two triangles together to make a quadrilateral) and build understanding of part-whole relationships as well as the properties of the original and composite shapes. As the combine shapes, they recognize them from different perspectives and orientations, describe their geometric attributes, and determine how they are alike and different, to develop the background for measurement and for initial understandings of properties such as congruence and symmetry

Operations and Algebraic Thinking - Represent and solve problems involving addition and subtraction
1.0A.A.1: Use addition and subtraction within 20 to solve word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using objects, drawings, and equations with a symbol for the unknown Table 1.)
1.OA.A.2: Solve word problems that call for addition of three whole numbers whose sum is less than or equal to 20 e.g., by using objects, drawings, and equations with a symbol for the unknown number to represent the problem.

Understand and apply properties of operations and the
relationship between addition and subtraction.
1.OA.B.3: Apply properties of operations as strategies to add and subtract. (Note: Students need not use formal terms for these properties.)
Examples: If $8+3=11$ is known, then $3+8=11$ is also known. (Commutative property of addition.) To add $2+6$ +4 , the second two numbers can be added to make a ten, so $2+6+4=2+10=12$. (Associative property of addition.)
1.OA.B.4: Understand subtraction as an unknown-addend problem. For example, subtract $10-8$ by finding the number that makes 10 when added to 8 .
Add and subtract within 20.
1.OA.C.5: Relate counting to addition and subtraction (e.g., by counting on 2 to add 2).
1.OA.C.6: Add and subtract within 20, demonstrating fluency for addition and subtraction within 10 . Use strategies such as counting on; making ten (e.g., $8+6=8+2+4=10+4$ $=14$ ); decomposing a number leading to a ten (e.g., $13-$ $4=13-3-1=10-1=9$ ); using the relationship between addition and subtraction (e.g., knowing that 8 + $4=12$, one knows $12-8=4$ ); and creating equivalent but easier or known sums (e.g., adding $6+7$ by creating the known equivalent $6+6+1=12+1=13$ ).
Work with addition and subtraction equations.
1.OA.D.7: Understand the meaning of the equal sign, and determine if equations involving addition and subtraction are true or false. For example, which of the following equations are true and which are false? $6=6,7=8-1$, $5+2=2+5,4+1=5+2$
1.OA.D.8: Determine the unknown whole number in an addition or subtraction equation relating to three whole numbers.

For example, determine the unknown number that makes
he equation true in each of the equations $8+$ ? $=11$ $5=\square-3,6+6=\square$
Number and Operations in Base Ten - Extend the counting sequence.
1.NBT.A.1: Count to 120 starting at any number les than 120 , In this range, read and write numerals and represent a number of objects with a written numeral.

## Understand place value.

1.NBT.B.2: Understand that the two digits of a two-digit number represent amounts of tens and ones. Understand the following as special cases:
a. 10 can be thought of as a bundle of ten ones - called a "ten."
b. The numbers from 11 to 19 are composed of a te and one, two, three, four, five, six, seven, eight, or nine ones.
c. The numbers $10,20,30,40,50,60,70,80,90$ refer to one, two, three, four, five, six, seven, eight, or nine tens (and 0 ones)
1.NBT.B.3: Compare two two-digit numbers based on meanings of the tens and ones digits, recording the results of comparisons with the symbols $>,=$, and < .
Use place value understanding and properties of operations to add and subtract
1.NBT.C.4: Add within 100 , including adding a two-digit number and a one-digit number, and adding a two-digit number and a multiple of 10 , using concrete models or drawing and strategies based on place value, properties of operations, and/or the relationship between addition and subtracion, relate he stragy to a wrten method and explain the reasoning used. Understand that in adding two-digit numbers, one adds tens and tens, ones and ones, and somelimes it is necessary to compose a ten
ven a two-digit number, monaly 10 more or 10 less than the number, without having to count; explain the reasoning used
1.NBT.C.6: Subtract multiples of 10 in the range $10-90$ from multiples of 10 in the range 10-90 (positive or zero differences), using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used
Measurement and Data - Measure lengths indirectly and by terating length units.
terating length units. two objects indirectly by using a third object.
1.MD.A.2: Express the length of an object as a whole number of length units, by laying multiple copies of a shorter objec (the length unit) end to end; understand that the length
measurement of an object is the number of same-size length units that span it with no gaps or overlaps. Limit to contexts where the object being measured is spanned by a whole number of length units with no gaps or overlaps.

## Tell and write time

.MD.B.3: Tell and write time in hours and half-hours using analog and digital clocks.
Represent and interpret data.
1.MD.C.4: Organize, represent, and interpret data with up to three categories; ask and answer questions about the total number of data points, how many in each category, and how many more or less are in one category than in another.

Geometry - Reason with shapes and their attributes.
.G.A.1: Distinguish between defining attributes (e.g., triangles are closed and three-sided) versus non-defining attributes (e.g., color, orientation, overall size); build and draw shapes to possess defining attributes.
1.G.A.2: Compose two-dimensional shapes (rectangles, squares, trapezoids, triangles half-circles, and quarter-circles) or three-dimensional shapes (cubes, right rectangular prisms, right circular cones, and right circular cylinders) to create a composite shape, and compose new shapes from the composite shape. (Note: Students do not need to learn formal names such as "right rectangular prism.")
1.G.A.3: Partition circles and rectangles into two and four equal shares, describe the shares using the words halves, fourths, and quarters, and use the phrases half of, fourth of, and quarter of. Describe the whole as two of, or four of the shares. Understand for these examples that decomposing into more equal shares creates smaller shares.

## Mathematical Practices

1. Make sense of problems and persevere in solving them.
. Reason abstractly and quantitatively.
. Construct viable arguments and critique the reasoning of others
2. Model with mathematics
. Use appropriate tools strategically.
. Attend to precision.
. Look for and make use of structure
. Look for and express regularity in repeated reasoning

Arizona's College and Career Ready Standards - Mathematics - 2 ${ }^{\text {nd }}$ Grade Standards Placemat
. Extending understanding of base-ten notation

- Students extend their understanding of the base-ten system. This includes ideas of counting in fives, tens, and multiples of hundreds, tens, and ones, as well as number relationships involving these units, including comparing. Students understand multi-dig numbers (up to 1000) written in base-ten notation recognizing that the digits in each place represen mounts of thousands, hundreds, tens, or ones (e.g., 853 is 8 hundreds +5 tens +3 ones)

2. Building fluency with addition and subtraction

- Students use their understanding of addition to develop fluency with addition and subtraction within 00. They solve problems within 1000 by applying their understanding of models for addition and subtraction, and they develop, discuss, and use efficient, accurate, and generalizable methods to compute sums and differences of whole numbers in base-ten notation, using their understanding of place value and the properties of operations. They select and accurately apply methods that are appropriate for the context and the numbers involved to mentally calculate sums and differences for numbers with only tens or only hundreds.

## . Using standard units of measure

- Students recognize the need for standard units of measure (centimeter and inch) and they use rulers and other measurement tools with the understanding hat linear measure involves iteration of units. They ecognize that the smaller the unit, the more terations they need to cover a given length

## 4. Describing and analyzing shapes

- Students describe and analyze shapes by examining heir sides and angles. Students investigate, escribe, and reason about decomposing and combining shapes to make other shapes. Through uilding, drawing, and analyzing two- and threedimensional shapes, students develop a foundation for understanding attributes of two- and threedimensional shapes, students develop a foundation for understanding area, volume, congruence, imilarity, and symmetry in later grades.

Operations and Algebraic Thinking - Represent and
solve problems involving addition and subtraction.
2.OA.A.1: Use addition and subtraction within 100 to solve one- and two-step word problems involving situations of adding to, taking from, putting together, taking apart, and comparing, with unknowns in all positions, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem. (Note: See Glossary, Table 1.)
Add and subtract within 20
2.OA.B.2: Fluently add and subtract within 20 using mental trategies. (Note: See standard 1.0A.6 for a list of mental strategies). By end of Grade 2, know from memory all sums of two one-digit numbers
Work with equal groups of objects to gain foundations for multiplication.
2.OA.C.3: Determine whether a group of objects (up to 20 ) has an odd or even number of members, e.g., by pairing objects or counting them by 2 s ; write an equation to express an even number as a sum o two equal addends.
2.OA.C.4: Use addition to find the total number of objects arranged in rectangular arrays with up to 5 rows and up to 5 columns; write an equation to expres the total as a sum of equal addends.
Number and Operations in Base Ten - Understand place value.
2.NBT.A.1: Understand that the three digits of a three-digit number represent amounts of hundreds, tens, and ones; e.g., 706 equals 7 hundreds, 0 tens, and 6 ones. Understand the following as special cases:
a. 100 can be thought of as a bundle of ten tens called a "hundred."
b. The numbers $100,200,300,400,500,600,700$ 800, 900 refer to one, two, three, four, five, six seven, eight, or nine hundreds (and 0 tens and 0 ones).
2.NBT.A.2: Count within 1000 ; skip-count by $5 \mathrm{~s}, 10$ s, and 100s.
2.NBT.A.3: Read and write numbers to 1000 using base-ten numerals, number names, and expanded form
2.NBT.A.4: Compare two three-digit numbers based on meanings of the hundreds, tens, and ones digits, using >, $=$, and < symbols to record the results o comparisons.

Use place value understanding and properties of operations to add and subtract
2.NBT.B.5: Fluently add and subtract within 100 using strategies based on place value, properties of operations, and/or the relationship between addition and subtraction
2.NBT.B.6: Add up to four two-digit numbers using strategies based on place value and properties of operations.
2.NBT.B.7: Add and subtract within 1000, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method. Understand that in adding or subtracting three-digit numbers, one adds or subtracts hundreds and hundreds, tens and tens, ones and ones; and sometimes it is necessary to compose or decompose tens or hundreds.
2.NBT.C.8: Mentally add 10 or 100 to a given number $100-$ 900 , and mentally subtract 10 or 100 from a given number 100-900
2.NBT.B.9: Explain why addition and subtraction strategies work, using place value and the properties of operations. (Note: Explanations may be supported by drawings or objects.)
Measurement and Data - Measure and estimate lengths in standard units.
2.MD.A.1: Measure the length of an object by selecting and using appropriate tools such as rulers, yardsticks, meter sticks, and measuring tapes
2.MD.A.2: Measure the length of an object twice, using length units of different lengths for the two measurements; describe how the two measurements relate to the size of the unit chosen
2.MD.A.3: Estimate lengths using units of inches, feet, centimeters, and meters.
2.MD.A.4: Measure to determine how much longer one object is than another, expressing the length difference in terms of a standard length unit.

## Relate addition and subtraction to length.

2.MD.B.5: Use addition and subtraction within 100 to solve word problems involving lengths that are given in the same units, e.g., by using drawings (such as drawings of rulers) and equations with a symbol for the unknown number to represent the problem
2.MD.B.6: Represent whole numbers as lengths from 0 on a number line diagram with equally spaced points
corresponding to the numbers $0,1,2, \ldots$, and represent whole-number sums and differences within 100 on a number line diagram.

## Work with time and money

MD.C.7: Tell and write time from analog and digital clocks to the nearest five minutes, using a.m. and p.m.
.MD.C.8: Solve word problems involving dollar bills, quarters, dimes, nickels, and pennies, using $\$$ and $\phi$ symbols appropriately. Example: If you have 2 dimes and 3 pennies, how many cents do you have?

## Represent and interpret data.

MD.D.9: Generate measurement data by measuring lengths of several objects to the nearest whole uni or by making repeated measurements of the same object. Show the measurements by making a line plot, where the horizontal scale is marked off in whole-number units
2.MD.D.10: Draw a picture graph and a bar graph (with single- unit scale) to represent a data set with up to four categories. Solve simple put together, takeapart, and compare problems using information presented in a bar graph. (Note:See Glossary, Table 1.)
Geometry - Reason with shapes and their attributes.
.G.A.1: Recognize and draw shapes having specified attributes, such as a given number of angles or a given number of equal faces. (Note: Sizes are compared directly or visually, not compared by measuring.) Identify triangles, quadrilaterals, pentagons, hexagons, and cubes.
2.G.A.2: Partition a rectangle into rows and columns of same-size squares and count to find the total number of them.
2.G.A.3: Partition circles and rectangles into two, three, or four equal shares, describe the shares using the words halves, thirds, half of, a third of, etc., and describe the whole as two halves, three thirds, four fourths. Recognize that equal shares of identical wholes need not have the same shape

## Mathematical Practices

. Make sense of problems and persevere in solving them
Reason abstractly and quantitatively.
. Construct viable arguments and critique the reasoning of others.
. Model with mathematics.
5. Use appropriate tools strategically.

Attend to precision.
Look for and make use of structure.
B. Look for and express regularity in repeated reasoning.

## Arizona's College and Career Ready Standards - Mathematics - 3rd Grade Standards Placemat

1. Developing understanding of multiplication and division and
strategies for multiplication and division within 100

- Students develop an understanding of the meanings of multiplication and division of whole numbers through activities and problems involving
equal-sized groups, arrays, and area models; multiplication is finding a unknown product, and division is finding an unknown factor in these situations. For equal-sized group situations, division can require finding the unknown number of groups or the unknown group size. Students use properties of operations to calculate products of whole numbers, using increasingly sophisticated strategies based on these properties to
solve multiplication and division problems involving single-digit factors. By comparing a variety of solution strategies, students learn the relationship between multiplication and division.
Developing understanding of fractions, especially unit fractions (fractions with numerator 1)
- Students develop an understanding of fractions, beginning with unit fractions. Students view fractions in general as being built out of un fractions, and they use fractions along with visual fraction models to represent parts of a whole. Students understand that the size of a
fractional part is relative to the size of the whole. For example, $1 / 2$ of the paint in a small bucket could be less paint than $1 / 3$ of the paint in a larger bucket; but $1 / 3$ of a ribbon is longer than $1 / 5$ of the same ribbon because when the ribbon is divided into 3 equal parts, the parts are longer than when the ribbon is divided into 5 equal parts. Students are
able to use fractions to represent numbers equal to, less than, and able to use fractions to represent numbers equal to, less than, and by using visual fraction models and strategies based on noticing equal numerators or denominators.
Developing understanding of the structure of rectangular arrays and of area
Students recognize area as an attribute of two-dimensional regions. They measure the area of a shape by finding the total number of same size units of area required to cover the shape without gaps or overlaps, area. Students understand that rectangular arrays can be or measuring area. Students understand that rectangular arrays can be decomposed into rectangular arrays of squares, students connect area to multipication, and justify using multiplication to determine the area of rectangle
Describing and analyzing two-dimensional shapes
Students describe, analyze, and compare properties of two-dimensiona shapes. They compare and classity shapes by their sides and angles, and connect these with definitions of shapes. Students also relate their fraction work to geometry by expressing the area of part of a shape as perations and Algebraic Thinking - Represent and solve problems involving multiplication and division
OA.A.1: Interpret products of whole numbers, e.g., interpret $5 \times 7$ as the total describe a context in which a total number of objects can be expressed as $5 \times 7$
3.OA.A.2: Interpret whole-number quotients of whole numbers, e.g., interpret 56 8 as the number of objects in each share when 56 objects are partitioned equally into 8 shares, or as a number of shares when 56 abjects are partitioned into equal shares of 8 objects each. For of groups can be expressed as $56 \div 8$.
3.OA.A.3: Use muttipication and division within 100 to solve word problems situations involving equal groups, arrays, and measurement quantities, e.g., by using drawings and equations with a symbol for the Table 2.)
3.OA.A.4: Determine the unknown whole number in a multiplication or division equation relating three whole numbers. For example, determine the unknown number that makes the equation true in each of the
equations $8 \times ?=48,5=\div 3,6 \times 6=$ ?

Understand properties of multiplication and the relationship between multiplication and division.
3.OA.B.5: Apply properties of operations as strategies to multiply and divide. (Note: Students need not use formal terms for these properties.)
Examples: If $6 \times 4=24$ is known, then $4 \times 6=24$ is also known. Examples: If $\times 4=24$ snown, then $4 \times 6=24$ is also known.
(Commutative property of multipication.) $3 \times 5 \times 2$ can be found by 3 $\times 5=15$, then $15 \times 2=30$, or by $5 \times 2=10$, then $3 \times 10=30$. (Associative property of multipicication.) Knowing that $8 \times 5=40$ and 8 $\times 2=16$, one can find $8 \times 7$ as $8 \times(5+2)=(8 \times 5)+(8 \times 2)=40+16$ $=56$. (Distributive property.)
3.OA.B.6: Understand division as an unknown-factor problem. For example, find
$32 \div 8$ by finding the number that makes 32 when multiplied by 8 .

## Multiply and divide within 100

3.OA.C.7: Fluently multiply and divide within 100 , using strategies such as the relationship between multiplication and division (e.g., knowing that $8 \times$
$5=40$, one knows $40 \div 5=8$ ) of Grade 3 , know from memory all products of two one-digit numbers.
Solve problems involving the four operations, and identify and explain 20A. 8 . patterns in arithmetic
A.D.8: Solve two-step word problems using the four operations. Represent these problems using equations with a letter standing for the unknown quantity. Assess the reasonableness of answers using mental computation and estimation strategies including rounding. (Note: This standard is limited to problems posed with whole numbers and
having whole-number answers; students should know how to perform having whole-number answers, otcden ws should e now how to perform specify a particular order -- Order of Operations.)
3.OA.D.9: Identify arithmetic patterns (including patterns in the addition table or multipication table), and explain them using properties of operation For example, observe that 4 times a number is always even, and explain why 4 times a number can be decomposed into two equal
addends.

Number and Operations in Base Ten - Use place value understanding and properties of operations to perform multi-digit arithmetic. (Note: A range of algorithms may be used.)
3.NBT.A.1: Use place value understanding to round whole numbers to the
3.NBT.A.2: Fluently add and subtract within 1000 using strategies and algorithms based on place value, properties of operations, and/or the relationship between addition and subtraction.
3.NBT.A.3: Multiply one-digit whole numbers by multiples of 10 in the range $10-$ $90($ e.g., $9 \times 80,5 \times 60$ ) using strategies based on place value and properties of operations.
Number and Operations - Fractions - Develop understanding of fraction as numbers.
Note: Grade 3 expectations in this domain are limited to fractions with
NF.A.1: Understand a fraction $1 / b$ as the quantity formed by 1 part when a quantity formed by a parts of size $1 / b$.
3.NF.A.2: Understand a fraction as a number on the number line; represen actions on a number line diagran
a. Represent a fraction $1 / b$ on a number line diagram by defining the parts. Recognize that ach phole and siza $1 /$ ing it into $b$ equal of the part based at 0 locates the number $1 / b$ on the number line.
b. Represent a fraction alb on a number line diagram by marking of $a$ lengths $1 / b$ from 0 . Recognize that the resulting interval has size $a / b$ and that its endpoint locates the number $a / b$ on the number
3.NF.A.3: Explain equivalence of fractions in special cases, and compare fractions by reasoning about their size.
Understand two fractions as equivalent (equal) if they are the same size, or the same point on a number line.
b. Recognize and generate simple equivalent fractions, e.g., $1 / 2=$ $24,4 / 6=2 / 3)$. Explain why the fractions are equivalent, e.g., by using a visual fraction model.
c. Express whole numbers as fractions, and recognize fractions that are equivalent to whole numbers. Examples: Express 3 in the form $3=3 / 1$; recognize that $6 / 1=6$; locate $4 / 4$ and 1 at the sam
Compare two fractio
denominator by reasoning about their size. Recognize that comparisons are valid only when the two fractions refer to the
con same whole. Record the results of comparisons with the symbol $>,=$, or $<$, and justify the conclusions, e.g., by using a visual
fraction model. fraction mode
Measurement and Data - Solve problems involving measurement and MDA 1 T 1 and writ ime to her .A.1: Tell and write time to the nearest minute and measure time intervals
in minutes. Solve word problems involving addition and subtraction of me intervals in minutes, e.g., by representing the problem on a number line diagram.
3.MD.A.2: Measure and estimate liquid volumes and masses of objects using standard units of grams (g), kilograms (kg), and liters (1). (Note. Excludes compound unis such as cms and inding the geometric volume of a container.) Add, subtract, multiply, or divide to solve one-
step word problems involving masses or volumes that are given in the same units, e.g., by using drawings (such as a beaker with a measurement scale) to represent the problem. (Note: Excludes multiticative comparison problems -- problems involving notions of
"times as much"; see Glossary, Table 2.)

## Represent and interpret data.

3.MD.B.3: Draw a scaled picture graph and a scaled bar graph to represent a data set with several categories. Solve one- and two-step "how many more" and "how many less" problems using information presented in square in the bar graph might represent 5 pets.
3.MD.B.4: Generate measurement data by measuring lengths using rulers marked with halves and fourths of an inch. Show the data by making a line plot, where the horizontal scale is marked off in appropriate
units-whole numbers, halves, or quarters.

Geometric measurement: understand concepts of area and relate area to multiplication and to addition.
3.MD.C.5: Recognize area as an attribute of plane figures and understand
ncepts of area measureme
a. A square with side length 1 unit, called "a unit square," is said to
have "one square unit" of area, and can be used to measure area

A plane figure which can be coverd with b. A plane figure which can be covered without gaps or ove
$n$ unit squares is said to have an area of $n$ square units.

Geometric measurement: understand concepts of area and relate area to
ultiplication and to addition
.MD.C.5: Recognize area as an attribute of plane figures and understand
concepts of area measurement.
a. A square with side length 1 unit, called "a units square," is said to
have "one square unit" of area, and can be used to measure area
b. A plane figure which can be covered without gaps or overlaps by $n$ unit squares is said to have an area of $n$ square units. square in, square ft, and improvised units).
3.MD.C.7: Relate area to the operations of multiplication and addition
a. Find the area of a rectangle with whole-number side lengths by nultipling the side lengths. multiplying the side lengths.
b. Multiply side lengths to find areas of rectangles with whole mathematical problems, and represent whole-number products a rectangular areas in mathematical reasoning.
c. Use tiling to show in a concrete case that the area of a rectangle with whole-number side lengths $a$ and $b+c$ is the sum of $a \times b$ ma $a \times$. Use area models to represent the distributive property mathematical reasoning.
d. Recognize area as additive. Find areas of rectilinear figures by the areas of the non-overlapping parts, applying this technique to solve real world problems.
Ceometric measurement recognize perimeter as an attribute of plane gures and distinguish between linear and area measures.
3.MD.A.8: Solve real world and mathematical problems involving perimeters of polygons, including finding the perimeter given the side lengths, nding an unknown side length, and exhibiting rectangles with 1 same perimeter and
different perimeters.
Geometry - Reason with shapes and their attributes.
G.A.1: Understand that shapes in different categories (e.g., rhombuses, and that the shared attributes and defines (e.g., having four sides) uadrilaterals). Recognize rhombuses, rectangles, and squares examples of quadrilaterals, and draw examples of quadrilaterals that do not belong to any of these subcategories.
3.G.A.2: Partition shapes into parts with equal areas. Express the area of eac part as a unit fraction of the whole. For example, partition a shape into
4 parts with equal area and describe the area of ech
and the area of the shape.

## Mathematical Practices

1. Make sense of problems and persevere in solving them
2. Reason abstractly and quantitatively
3. Construct viable arguments and critique the reasoning of others.

Model with mathematics.
5. Use appropriate tools strategically.
. Attend to precision.
7. Look for and make use of structure.
. Look for and express regularity in repeated reasoning.

Arizona's College and Career Ready Standards - Mathematics - $4^{\text {th }}$ Grade Standards Placemat
. Developing understanding and fluency with multi-digit multiplication and developing understanding of dividing to find quotients involving

- Students generalize their understanding of place value to $1,000,000$, understanding the relative sizes of numbers in each place. They apply
their understanding of models for multiplication (equal-sized groups arrays, area models), place value, and properties of operations, in particular the distributive property, as they develop, discuss, and use efficient, accurate, and generaizabbe methods to compute products of mult-digit whole numbers. Depending on the numbers and the contex they select and accurately apply appropriate methods to estimate
mentally calculate products. They develop fluency with efficient procedures for multiplying whole numbers; understand and explain why he procedures work based on place value and properties of operations; and use them to solve problems. Students apply their understanding models for division, place value, properties of operations, and the use efficient, accurate, and generalizable procedures to find quotients involving multi-digit dividends. They select and accurately apply appropriate methods to estimate and mentally calculate quotients, and interpret remainders based upon the contex

2. Developing an understanding of fraction equivalence, addition and denominators, multiplication of fractions by whole number

- Students develop understanding of fraction equivalence and operation (e.g., $15 / 9=5 / 3$ ), and they develop methods for generating and recognizing equivalent fractions. Students extend previous understandings about how fractions are built from unit fractions, composing fractions from unit fractions, decomposing fractions into uni fractions, and using the meaning of fractions and the meaning of
multiplication to multiply a fraction by a whole number.

3. Understanding that geometric figures can be analyzed and classified sides, particular angle sides, particular angle measures, and symmetry
Students describe, analyze, compare, and classify two-dimensiona shapes. Through building, drawing, and analyzing two-dimensiona shapes, students deepen their understanding of properties of twosymmetry
perations and Algebraic Thinking - Use the four operations with whole umbers to solve problems.
4.OA.A.1: Interpret a multiplication equation as a comparison, e.g., interpret $35=$ $5 \times 7$ as a statement that 35 is 5 times as many as 7 and 7 times as as multiplication equations.
4.OA.A2: Multiply or divide to solve word problems involving multiplicative mparison eg by using drawings and equations with a symbol for the unknown number to represent the problem, distinguishing multiplicative comparison from additive comparison. (Note: See Glossary, Table 2.)
4.OA.A3: Solve multistep word problems posed with whole numbers and having in which remainders must be interpreted. Represent these problems using equations with a letter standing for the unknown quantity Assess the reasonableness of answers using mental computation and estimation strategies including rounding
A..4.OA.A.3. 1 Solve a variety of problems based on the mutipication principle of counting.
a. Represent a variety of counting problems using arrays, charts, and systematic lists, e.g., tree diagram.
b. Analyze rialionships attong representaitions and make

Gain familiarity with factors and multiples.
4.OA.B.4: Find all factor pairs for a whole number in the range 1-100. Recognize whether a given whole a mumber in the range 1 -100 is a Defermine whether a given whole number in te range - digit number. Determine whether a given whole number in the range- $1-100$ is prime or composite.
Generate and analyze patterns.
4.OA.B.5: Generate a number or shape pattern that follows a given rule. Identify For example, given the rule " generate terms in the resulting sequence and observe that the terms appear to alternate between odd and even numbers. Explain
informally why the numbers will continue to alternate is way
Number and Operations in Base Ten - Note: Grade 4 expectations in this Generalize place value understanding for multi-digit whole numbers.
4.NBT.A.1: Recognize that in a multi-digit whole number, a digit in one place example, recoonize that $700 \div 70=10$ by applying concepts of place value and division.
4.NBT.A.2: Read and write multi-digitit whole numbers using base-ten numerals, number names, and expanded form. Compare two multi-digit numbers based on meanings of the digits in each place, using $>=$, , and
4.NBT.A.3: Use place value understanding to round multi-digit whole numbers to any place.
Use place value understanding and properties of operations to perform metic.
4.NBT.B.4: Fluently add and subbract mult-digit whole numbers using the standard algorithm.
4.NBT.B.5: Multiply a whole number of up to four digits by a one-digit whole number, and multiply two two-digit numbers, using strategies based on place value and the properties of operations. Illustrate and explain the calcul.
models.
4.NBT.B.6: Find whole-number quotients and remainders with up to four-digit dividends and one-digit divisors, using strategies based on place
value, the properties of operations, andlor the relationship between multipication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models.
$\frac{\text { Number and Operations - Fractions - Note: Grade } 4 \text { expectations in this }}{\text { domain are limited to fractions with denominators } 2,3,4,5,6,8,10,12, \& 100}$ Extend understanding of fraction equivalence and ordering.
4.NF.A.1: Explain why a fraction alb is equivalent to a fraction $(n \times a)(n \times b)$ by using visual fraction models, with attention to how the number and
size of the parts differ even though the two fractions themselves are size of the parts differ even though the two fractions themselves are fractions.
4.NF.A.2: Compare two fractions with different numerators and different denominators, e.g., by creating common denominators or numerators, or by comparing to a benchmark fraction such as $1 / 2$. Recognize that comparisons are valid only when the two fractions refer to the same whole. Record the results of comparisons with symbols $\gg=$, or $<$, and
justify the condusions, e.g., by using a visual fraction model.
Build fractions from unit fractions by apolying and extending previous understandings of operations on whole numbers.
4.NF B.3: Understand a fraction $a / b$ with $a>1$ as a sum of fractions $1 / b$.
a. Understand adation and subtraction of fracions as joining and ring to the same whole.
b. Decompose a fraction into a sum of fractions with the same by an equation. Justity decompositions, e.g, by using a visual by an equation. Jusitif yecompositions, e.g., by using a visual
fraction model. Examples: $3 / 8=1 / 8+1 / 8+1 / 8 ; 3 / 8=1 / 8+2 / 8$, $21 / 8=1+1+1 / 8=8 / 8+8 / 8+1 / 8$.
c. Add and subtract mixed numbers with like denominators, e.g., by replacing each mixed number with an equivalent fraction, and/or by using properties of operations and the relationship between addition and subtraction.
d. Solve word problems involving addition and subtraction of fractions referring to the same whole and having like denominatrs, e.g., by using visual fraction models and equation
to represent the problem
4.NF.B.4: Apply and extend previous understandings of multipication to multipy a fraction by a whole number.
. Understand a fraction alb as a multiple of $1 / b$. For example, use visual fraction model to represent $5 / 4$ as the product $5 \times(1 / 4)$, recording the conclusion by the equation $5 / 4=5 \times(1 / 4)$.
b. Understand a multiple of $a / b$ as a multiple of $1 /$, and use this understanding to multitly a fraction by a whole number. For $(1 / 5)$, recognizing this product as $6 / 5$. ( $/$ I general, $n \times(a / b)=(n \times$ a) ${ }^{(1 / 5), \text { ). }}$ r
c. Solve word problems involving multipication of a fraction by whole number, e.g., by using visual fraction models and equations to represent the problem. For example, if each person at a party will eat $3 / 8$ of a pound of roast beef, and there will be 5 people the party, how many pounds of roast beef will be needed?
Between what two whole numbers does your answer lie?
Understand decimal notation for fractions, and compare decimal fractions. 4.NF.C.5: Express a fraction with denominator 10 as an equivalent fraction with enominator 100 , and use this technique to add two fractions with $30 / 100$, and add $3 / 10+4 / 100=34 / 100$. (Note: Students who can generate equivalent fractions can develop strategies for adding subtraction with unlike denominators in general is not a requirement at this grade.)
4.NF.C.6: Use decimal notation for fractions with denominators 10 or 100 . For example, rewrite 0.62 as $62 / 100$; describe a length as 0.62 meters; ocate 0.62 on a number line diagram.
4.NF.C.7: Compare two decimals to hundredths by reasoning about their size, Recognize that comparisons are valid only when the two decimals efer to the same whole. Record the results of comparisons with the symbols >, =, or <, and justify the conclusions, e.g., by using a visual model.
Measurement and Data - Solve problems involving measurement and conversion of measurements from a larger unit to a smaller unit.
4.MD.A.1: Know relative sizes of measurement units within one system of units including $\mathrm{km}, \mathrm{m}, \mathrm{cm} ; \mathrm{kg}, \mathrm{g} ; \mathrm{ll}, \mathrm{oz}, \mathrm{I}, \mathrm{ml}$; hr , min, sec. Within a single system of measurement, express measurements in a larger unit in column of tabme. For example Record measurement equivalents in a twoExpress the lenoth example, know that 1 t is 12 times as long as 1 in Express the length of a 4 ft snake as 48 in. Generate a conversion table for
$(3,36)$
4.MD.A.2: Use the four operations to solve word problems involving distances, intervals of time, liquid volumes, masses of objects, and money,
including problems involving simple fractions or decimals, and in terms of a smaller unit. Represent measurement guantities using in terms of a smaller unit. Represent measurement quantities using
diagrams such as number line diagrams that feature a measurement scale.
4.MD.A.3: Apply the area and perimeter formulas for rectangles in real world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the are tion equation with an unknown factor.

## epresent and interpret data

4.MD.B.4: Make a line plot to display a data set of measurements in fractions of a unit $(1 / 2,1 / 14,1 / 8)$. Solve problems involving addition and subtractio of fractions by using information presented in line plots. For example,
from a line plot tind and interpet the difference in length between the longest and shortest specimens in an insect collection.

## Geome

MD. C. . Recognize angles as geometric shapes that are formed wherver two rays share a common endpoint, and understand concepts of angle measurement:
a. An angle is measured winh reference to a circle with is center al the common endpoint of the rays, by considering the fraction of he circular arc between the points where the two rays intersect "one-degree angle," and can be used to measure angles.
b. An angle that turns through $n$ one-degree angles is said to have An angle that turns through $n$ on
degrees using a protractor. Sketch angles of specified measure
4.MD.C.7: Recognize angle measure as additive. When an angle is decomposed into non-overlapping parts, the angle measure of the whole is the sum of the angle measures of the parts. Solve addition and subtraction problems to ind unknown angles on a diagram in real world and mathematical problems, e.g., by using an equation with a symbol for
the unknown angle measure
Geometry -Draw and identify lines and angles, and classify shapes by
roperties of their lines and angles.
4.G.A.1: Draw points, lines, line segments, rays angles (right acute obtuse) and per
figures.
4.G.A.2: Classify two-dimensional figures based on the presence or absence of parallel or perpendicular lines, or the presence or absence of angles of a specified size. Recognize right triangles as a category, and identify right triangles.
G.A.3: Recognize a line of symmetry for a two-dimensional figure as a line aross the figure such that the figure can be folded along the line into matching pa
symmetry.

## Mathematical Practices

Make sense of problems and persevere in solving them
Reason abstractly and quantitatively.
Construct viable arguments and critique the reasoning of others.
. Model with mathematics.
. Use appropriate tools strategically.
6. Attend to precision.
. Look for and express regularity in repeated reasoning.

Developing fluency with addition and subtraction of fractions, developing understanding of the multiplicaction of fractions and of
divivision of fractions in limited cases (unit fractions divided by whol numbers and whole numbers divided by unit fractions)

- Students apply their understanding of fractions and fraction models to represent the addition and subtraction of fractions with unlike denominators as equivalent calculations with like denominators. They
develop fluency in calculating sums and differences of fractions, and develop fluency in calculating sums and differences of fractions, and
make reasonable estimates of them. Students also use the meaning make reasonable estimates of hem. Stuaenis also use hese m , between multipication and division to understand and explain why the procedures for multiplying and dividing fractions make sense. (Note: this is limited to the case of diviving unit fractions by whole numbers and whole numbers by unit fractions.)
Extending division to 2 -digit divisors, integrating decimal fraction into the place value system and developing understanding of operations with decimals to hundredths, and developing fluency with -
- Students develop understanding of why division procedures work ased on the meaning of base-ten numerals and properties of multiplication, and divivision. They apply their understandingos of model multipication, and division. They apply their understandings of mode
for decimals, decimal notation, and properties of operations to add and subtract decimals to hundredths. They develop fluency in these computations, and make reasonable estimates of their results, Students use the relationship between decimals and fractions, as well
as the relationship between pinite decimals and whole as the relationship between finite decimals and whole numbers (i.e.,
finite decimal multiplied by an appropriate power of 10 is a whole number), to understand and explain why the procedures for multiplying and dividing finite decimals make sense. They compute products and quotients of decimals to hundredths efficiently and accurately.
Developing understanding of volume
- Students recognize volume as an attribute of three-dimensional space. They understand that volume can be quantified by finding the
total number of same-size units of volume required to fill the space without gaps or overlaps. They understand that a 1 -unit by 1 -unit by 1 unit cube is the standard unit for measuring volume. They select appropriate units, strategies, and tools for solving problems that involve estimating and measuring volume. They decomposest three-
dimensional shapes and find volumes of right rectangular risms by dimensional shapes and find volumes of right rectangular prisms by
viewing them as decomposed into layers of arrays of cubes. They measure necessary attributes of shapes in order to solve real world and mathematical problems.

## perations and Algebraic Thinking - Write and interpret numerical

 expressions.OA.A.1: Use parentheses, brackets, or braces in numerical expressions, and .A. evaluate expressions with, these symbols.
5.OA.A.2: Write simple expressions that record calculations with numbers, and interpret numerical expressions without evaluating them. For example express the calculation "add 8 and 7 , then multiply by 2 " as $2 \times(8+7$ ). Recognize that $3 \times(18932+921$ is inree times as large as 1932

## nalyze patterns and relationships.

5.OA.B.B: Generate two numerical patterns using two given rules. Identify apparent relationships between corresponding terms. Form ordered pairs consisting of corresponding terms from the two patterns, and graph the orddered pairs on a coordinate plane. For example, given the
rule "Add 3 " a and the starting number 0 and given the rule "Add 6 " and the starting number 0 , generate terms in the resulting sequences, and
observe that the terms in one sequence are twice the corresponding Number and Operations in Base Ten - Understand the place value system. 5.NBT.A.1: Recognize that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its righ
and $1 / 10$ of what it represents in the place to tits left
5.NBT.A.2: Explain patterns in the number of zeros of the product when
multiplying a number by powers of 10 , and explain patterns in the
placement of the decimal point when a decimal is multiplied or divided
by a power of 10 . Use whole-number exponents to denote powers of
10 .
5.NBT.A.B: Read, write, and compare decimals to thousandths.
a. Read and write decimals to thousandths using base-ten numerals, number names, and expanded form, e.g., $347.392=3$
b. Compare two decimals to thousandths based on meanings of he digits in each place, using $>,=$, and < symbols to record the results of comparisons
5.NBT.A.4: Use place value understanding to round decimals to any place.

Perform operations with multi-digit whole numbers and with decimals to hundredths.
5.NBT.B.5: Fluently multiply multi-digit whole numbers using the standard algorithm.
5.NBT.B.6: Find whol

NBT.B.6: Find whole-number quotients of whole numbers with up to four-digit dividends and two-digit divisisrs, using strategies based on place multiplication and division. Illustrate and explain the calculation by using equations, rectangular arrays, and/or area models.
5.NBT.B.7: Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, andior the relationship between adadition and reasoning used.
Number and Operations - Fractions - Use equivalent fractions as a strategy to add and subtract fractions.
5.NF.A.1: Add and subtract fractions with unlike denominators (including mixed numbers) by replacing given fractions with equivalent fractions in such
a way as to produce an equivalent sum or difference of fractions with like denominators. For example, $2 / 3+5 / 4=8 / 12+15 / 12=23 / 12$. (ln general, $a / b+c / d=(a d+b c) / b d$.)
5.NF.A.2: Solve word problems involving addition and subtraction of fractions referring to the same whole, including cases of unlike denominators, e.g., by using visual fraction models or equations to represent the estimate mentally and assess the reasonableness of answers. For example, recognize an incorrect result 2/5 $+1 / 2=3 / 7$, by observing example, recos
that $3 / 7<1 / 2$.
Apply and extend previous understandings of multiplication and division to 5inf and divide fractions.
5.NF.B.3: Interpret a fraction as division of the numerator by the denominator $(a / b=a \div b)$. Solve word problems involving division of whole
numbers leading to answers in the form of fractions or mixed numbers, e.g., by using visual fraction models or equations to represent the problem. For example, interpret $3 / 4$ as the result of dividing 3 by 4 , noting that $3 / 4$ multiplied by 4 equals 3 , and that when of size $3 / 4$. If 9 people want to share a 50 -pound sack of rice equally by weight, how many pounds of rice should each person get?
Between what two whole numbers does your answer liee?
5.NF.B.4: Apply and extend previous understandings of multiplication to multipy a fraction or whole number by a fraction.
a. Interpret the product $(a / b) \times q$ as $a$ parts of a partition of $q$ into $b$ equal parts; equivalently, as the result of a sequence of operations
$a \times q \div b$. For example, use a visual fraction model to show $(2 / 3) \times$ $4=8 / 3$, and create a story context for this equation Do the sam with $(2 / 3) \times(4 / 5)=8 / 15$. (II general), $(a / b) \times(c / d)=a c / b d)$
b. Find the area of a rectangle with fractional side lengths by tiling it show that the area is the same as would be found by multiplying the side lengths. Mutipipy fractional side lengths to find areas of rectangles, and represent fraction products as rectangular areas.
5.NF.B.5: Interpret multiplication as scaling (resizing), by

Comparing the size of a product to the size of one factor on the
basis of the size of the other factor, without performing the indicated multiplication.
b. Explaining why multiplying a given number by a fraction greater than 1 results in a product greater than the given number (recognizing multipicication by whole numbers greater than 1 as a familiar case); explaining why multiplying a given number by a
fraction less than 1 results in a product smaller than the given fraction less than 1 results in a product smaller than the given
number; and relating the principle of fraction equivalence a/b $=$ $(n \times a) /(n \times b)$ to the effect of multiplying a/b by 1 .
5.NF.B.6: Solve real world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem.
5.NF.B.7: Apply and extend previous understandings of division to divide unit Note: Students abmbers and whole numbers by unit fractions. Notee. Students able to multiply fractions in general can develop strategies to divide fractions in general, by reasoning about the fraction by a fraction is not a requirement at this grade.)
a. Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. For example, create a story contex
for $(1 / 3) \div 4$, and use a visual fraction model to show the quotien Use the relationship between multipication and division to expla that $(1 / 3) \div 4=1 / 12$ because $(1 / 12) \times 4=1 / 3$.
b. Interpret division of a whole number by a unit fraction, and compute such quotients. For example, create a story context for 4 (115), and use a visual fraction model to show the quotient. Use $4 \div(1 / 5)=20$ because $20 \times(1 / 5)=4$.
c. Solve real world problems involving division of unit fractions by non-zero whole numbers and division of whole numbers by unit ractions, e.g., by using visual fraction models and equations to represent the problem. For example, how much chocolate will How many $1 / 3$-cup servings are in 2 cups of raisins?
Measurement and Data - Convert like measurement units within a given measurement system.
5.MD.A.1: Convert among different-sized standard measurement units within a these conversions in solving multi-step, real world problems.

## Represent and interpret data

5.MD.B.2: Make a line plot to display a data set of measurements in fractions of
a unit $(1 / 2,1 / 4,1 / 8)$. Use operations on fractions for this grade to
solve problems involving information presentid in line plots. For
find the amount of liquid each beaker would contain if the total amount in all the beakers were redistributed equally.
eometric measurement: understand concepts of volume and relate volume to multiplication and to addition.
5.MD.C.3: Recognize volume as an attribute of solid figures and understand
a. A cube with side length 1 unit, called a "unit cube," is said to Alum volume
A solid figure which can be packed without gaps or overlaps 5.MD.C.4: Measure volumes by counting unit cubes, using cubic cm , cubic in, 5.MD.C.4. Measure evoumes by counting
cubic $f$ t, and improvised units.
5.MD.C.5: Relate volume to the operations of multiplication and addition and

Relate volume to the operations of mutipicication and addition an
solve real world and mathematical problems involving volume.
a. Find the volume of a right rectangular prism with whole-number side lengths by packing it with unit cubes, and show that the
volume is the same as would be found by multiplying the edg lengths, equivalently by multiplying the height by the area of the base. Represent threefold whole-number products as volumes, e.g., to represent the associative property of multiplication.
b. Apply the formulas $V=1 \times w \times h$ and $V=b \times h$ for rectangular prisms to find volumes of right rectangular prisms with whole-
number edge lengths in the context of solving real world and mathematical problems.
c. Recognize volume as additive. Find volumes of solid figures composed of two non-overlapping right rectangular prisms by adding the volumes of the non-overlapping parts, applying this

Geometry - Graph points on the coordinate plane to solve real-world and mathematical problems.
5.G.A.1: Use a pair of perpendicular number lines, called axes, to define a coordinate system, with the intersection of the lines (the origin) arranged to coincide with the 0 on each line and a given point in the plane located by using an ordered pair of numbers, called its rravel from the origin in the direction of one axis, and the second number indicates how far to travel in the direction of the second axis, with the convention that the names of the two axes and the coordinates correspond (e.g., $x$-axis and $x$-coordinate, $y$-axis and $y$ -
5.G.A.2: Represent real world and mathematical problems by graphing points in the first quadrant of the coordinate plane, an
values of points in the context of the situation.

Classify two-dimensional figures into categories based on their properties
5.G.B.3: Understand that attributes belonging to a category of two-dimensiona all rectangles have four right angles and squares are rectangles, so al squares have four right angles.
5.G.B.4: Classify two-dimensional figures in a hierarchy based on properties.

## Mathematical Practices

. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.

Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
. Use appropriate tools strategically.
Attend to precision.
8. Look for and express regularity in repeated reasoning

## Arizona's College and Career Ready Standards - Mathematics - 6th $^{\text {th }}$ Grade Standards Placemat

1. Connecting ratio and rate to whole number multiplication and division and
using concepts of ratio and rate to solve problems using concepts of ratio and rate to solve problems

Students use reasoning about multipication and division to solve ratio and rate
problems about quantities. By viewing equivalent ratios and rates as deriving problems about quanntites. By biewing equivalent ratios and dates as deriving
from, and extendigng pais of ows (or colums) in the muttipicaction table, and
by andying simple
 students connect their understanding of multipicication and division with ratios
and rates. Thus students expand the scope of problems for which they can use multipication and division to solve problems, and they connect ratios and
fractions. Students solve a wide variety of problems involving ratios and rates.
2. Completing understanding of division of fractions and extending the notion of

- Students use the meaning of fractions, the meanings of multipication and
 and explain why the prococedurester for divididing fratation and make sense. Students use these operations to solve problems. Students extend their previous
understandings of fumber and the ordering of ummers to the fuls system of
nater rational numberss which includdes negadeative rational numbers, and in particular
negative integers. They reason about the negative integess. They reason about the ordere and absolute avalue of frational
numbers and about the location of points in all four quadrants of the coordinate numbers
plane.

3. Writing, interpreting, and using expressions and equations Students understand the use of variables in mathematical expressions. They
write expressions and equations that correspond to given situations, evaluate expressions, and use expressions and formulas to solve problems. Students the properties of operations to rewitte expressions in equivalent forms. Students know that the solutions of an equation are the values of the variables
 one-step equations. Students construct and analyze tabbess such has tables of quantities that are in equivalent ratios, and they use equations (such as $3 x=y$ ) to describe relationships between quantities.
Developing understanding of statistical thinkking Buiding on and reinforcing their understanding of number, students begin to Building on and reinforcing their understanding of number, students begin to
develop their abilty to think statisitically Students recognize that a data
dstribution max not have a definite center and that different ways to measure distribution may not have a definite centerand hat dififerent ways to measure
center yield different values. The median measures center in the sense that it
is sroughly the middle value. The mean measures center in the sense that it is The value that each data point would take on if the total of the data valueswers ecoognize that a measure of variability (interquartilie range or meant absolute
deviation) can also be usefu for summarizg sets of datata can have the same mean and median yet be disitinguished by thei sets of data can have hie same mean and median yet be isitinguished by
variabilty. Students learn to describe and summarize numerical data sets,
tidetsing dentifing custers, peaks, caps, and symmetry, considering the context in
which the data were collected.
atios and Proportional Relationships - Understand ratio concepts and use ras
6.RP.A.1: Understand the concept of a ratio and use ratio language to describe a to beaks in the bird house at the zoo was $2: 1$, because for every 2 wings there was 1 beak." "For every vote candidate A received, candidate C received nearly three votes.
6.RP.A.2: Understand the concept of a unit rate alb associated with a ratio a:b with $b$ $\neq 0$, and use rate language in the context of a ratio relationship. For
example, TThis recipe has a ratio of 3 cups of flour to 4 cups of sugar, so example, "This recipe has a aratio of 3 cups of flour to 4 cups of sugar, so
there is $3 / 4$ cup of four for each cup of sugar." We paid $\$ 55$ for 15 hamburgers, which is a rate of $\$ 5$ per hamburger." "Note: Expectations for unit
rates in this grade are limited to ono-complex fractions.) rates in this grade are linited to non-complex fractions.)
6.RP.A.3: Use ratio and rate reasoning to solve real-world and mathematical problems, e .g., by reasoning about tables of equivaiens.
diagrams, double number line diagrams, or equations.
a. Make tables of equivalent ratios relating quantities with whole-number measurements, find missing values in the tables, and plot the pair
values on the coordinate plane. Use tables to compare ratios.
b. Solve unit rate problems including those involving unit pricing and that rate, how many lawns could be mowed in 35 hours? At what rate that rate how many lawns
were lawns being mowed?
c. Find a percent of a quantity as a rate per 100 (e.g., $30 \%$ of a quantity
means $30 / 100$ times the quantity); solve problems involving finding th means $30 / 100$ times the quantity); solve problems involving finding the
whole, given a part and the percent.
d. Use ratio reasoning to convert measurement units; manipulate and

The Number System - Apply and extend previous understandings of multiplication and division to divide fractions by fractions.
6.NS.A. $:$ : Interpret and compute quotients of fractions, and solve word problems models and equations to represent the problem. For example, create a stor context for $(2 / 3) \div(3 / 4)$ and use a visual fraction model to show the quotient; use the relationship between multipicication and division to explain
that $(2 / 3) \div(3 / 4)=8 / 9$ because $3 / 4$ of $8 / 9$ is $2 / 3$. (In general., $(a / b) \div(/ d d)=$ that $(2 / 3) \div(3 / 4)=8 / 9$ because $3 / 4$ of $8 / 9$ is $2 / 3$. (In general, (a/b) $\div(/ / d d)=$
adbc.) How much chocolate will each person get if 3 people share $1 / 1 / 21 b$ of chocolate equally? How many $3 / 4$-cup senvings are in $2 / 3$ of a cup of yogur? How wide is a rectangular strip of land with length $3 / 4$ mi and area
$1 / 2$ square mi? $1 / 2$ square mi?
Compute fluently with multi-digit numbers and find common factors and multiples.
6.NS.B.2: Fluently divide mult-digit numbers using the standard algorithm.
6.NS.B.3: Fluently add, subtract, multiply, and divide mult--igigit decimals using the standard algorithm for each operation.
6.NS.B.4: Find the greatest common factor of two whole numbers less than or equal to 100 and the least common multiple of two whole numbers less than or equal
to 12. Use the distributive property to express a sum of two to 12 . Use the distributive property to express a sum of two whole numbers
$1-100$ with a common factor as a multiple of a sum of two whole numbers 1-100 with a common factor as a multiple of a sum of two whole nu
with no common factor. For example, express $36+8$ as $4(9+2)$.
Apply and extend previous understandings of numbers to the system of rational numbers.
6.NS.C.5: Understand that positive and negative numbers are used together to describe quantities having opposite directions or values (e.g., temperature abovelbelow zero, elevation above/below sea level, credits/debits,
positive/negative electric charge): use positive and negative numbers to represent quantities in real-world contexts, explaining the meaning of 0 in each situation.
6.NS.C.6: Understand a rational number as a point on the number line. Extend number line diagrams and coordianate axes familiar from previous grades to
a. Recognize opposite signs of numbers as indicating locations on opposite sides of 0 on the number line; recognize that the opposite of the opposite of a number is the number itself, e.g., $-(-3)=3$, and that 0 is its own
opposite.
b. Understand signs of numbers in ordered pairs as indicating locations in quadrants of the coordinate plane; recognize that when two ordere
pairs $\mathbf{y}$ iffer only by signs, the locations of the points are related by peflections across one or both axes.
c. Find and position integers and other rational numbers on a horizontal or retional numbers on a coordinate plane.
6. NS.C.7: Understand ordering and absolute value of rational numbers.
a. Interpret statements of inequality as statements about the relative interpret - $3>-7$ as a statement that -3 is located to the right of -7 on a number line oriented from left to right.
b. Write, interpret, and explain statements of order for rational numbers in
real-world contexts. For example, write $-3^{\circ} \mathrm{C}>-7^{\circ} \mathrm{C}$ to express the fact real-world contexts. For example, write $-3^{\circ} \mathrm{C}>-7^{\circ} \mathrm{C}$ to express the fact
that $-3^{\circ} \mathrm{C}$ is warmer than $-7^{\circ} \mathrm{C}$.

Understand the absolute value of a rationa number as its distance from negative quantity in a real-world situation For example for an account balance of -30 dollars, write $|-30|=30$ to describe the size of the debt in balance
dollars.
d. Distinguish comparisons of absolute value from statements about order. For example, recognize that an account balance less than -30 dollars represents a debt greater than 30 doliars. 8: Solve real-world and mathematical problems by graphing points in all four
quadrants of the coordinate plane. Include use of coordinates and absolut value to find distances between points with the same first coordinate or the same second coordinate.
AZ.6. NS.C.9: Convert between expressions for positive rational numbers, including
fractions, decimals, and percents.
Expressions and Equations - Apply and extend previous understandings of arithmetic to algebraic expressions.
6.EE.A.1: Write and evaluate numerical expressions involving whole-number

6EEA.2. Write read
a. Write expressionate expressions in which letters stand for numbers. Wrte expressions that record operations with numbers and with letters
standing for numbers. For example, express the calculation "Subtract standing for numb.
from $5^{\prime}$ as $5-y$.
b. Identify parts of an expression using mathematical terms (sum, term product, factor, quotient, coeficient); ,iew one or more parts of an
expression as a single entity. For example describe the enpresion +7 ) as a product of two factors, view ( $8+7$ ) as both a single entity and a sum of two terms.
Evaluate expressions at speciicic values of their variables. Include Perform arithmetic operations indududing those involving whoblems. Perform arithmetic operations, including those involving whol--number
exponents, in the conventional order when there are no parentheses to specify a particular order (Order of Operations). For example, use the formulas $V=s^{3}$ and $A=6 s^{2}$ to find the volume and surface area of a cube with sides of length $s=1 / 2$.
6.EE.A.3: Apply the properties of operations to generate equivalent expressions. Fo example, apply the distributive property to the expression $3(2+x)$ to
produce the equivialent expression $6+3 x$; apply the distributive roperty the expression $24 x+18 y$ to produce the equivalent expression $6(4 x+3 y)$
apply properties of operations to $y+y+\gamma$ to produce the apply properties of operations to $y+y+y$ to produce the equivalent
expression $3 y$.
6.EE.A.4: Identify when two expressions are equivalent (i.e., when the two expressions name the same number regardless of which value is
substitute into them.).For example, the expressions $y+y+y$ and $3 y$ are
equivalent beccuase they name the same number regardless of which equivalent tbecause
Reason about and solve one-variable equations and inequalities,
6.EE.B.5: Understand solving an equation or inequality as a process of answering a inequality true? Use substitution to determine whether a given number in specified set makes an equation or inequality true
6.EE.B. 6 : Use variables to represent numbers and write expressions when solving a real-world or mathematical problem; understand that a variable can represent an unknown number, or, depending on hie purpose alt
number in a specified set.
6.EE.B.T: Solve real-world and mathematical problems by writing and solving equations of the form $x+p=q$ and $p x=q$ for cases in which $p, q$ and $x$
all nonnegative rational numbers.
6.EE.B.8: Write an inequality of the form $x>c$ or $x<c$ to represent a constraint inequalities of the form $x>c 0 x<$ chave infinitly $m$ solytion inequalities of the form $x>c$ or $x<c$ have infinitely many solutions;
represent solutions of such inequalities on number line diagrams.
Represent and analyze quantitative relationships between dependent and
6.EE.C.9: Use variables to represent two quantities in a real-world probbem that change in realitionstip to one another, write an equation to express one thought of as the independent variable. Analyze the relationship between the dependent and independent variables using graphs and tables, and relate hese to the equation. For example, in a problem involving motion at constant speed, ist and graph ordered pairs of distances and imes, and wite the
equation $d=65 t$ to represent the relationship between distance and time.
Geometry - Solve real-world and mathematical problems involving area, surface area, and volume.
6.G.A.1: Find the area of right triangles, other triangles, special quadrilaterals, and other shapess; apply these techniques in the context of solving real-world and mathematical problems
6.G.A.2: Find the volume of a right rectangular prism with fractional edge lengths by packing it with unit cubes of the appropriate unit fraction edge engths, and
show that the volume is the same as would be found by multiplying the edge lengths of the prism. Apply the formulas $V=I w h$ and $V=b h$ to find volume of right rectangular prisms with fractional edge lengths in the context of solving real-world and mathematical problems.
6.G.A.3: Draw polygons in the coordinate plane given coordinates for the vertices; coordinate or the same second coordinate. Apply these techniques in the context of solving real-world and mathematical problems.
6.G.A.4: Represent three-dimensional figures using nets made up of rectangles and triangles, and use the nets to find the surface area of these figures. Apply these techni
problems.
Statistics and Probability - Develop understanding of statistical variability.
6.SP.A.1: Recognize a staristical question as one that anticipates vais data related to the question and accounts for it in the answers. For example, "How old am I?" is not a statistical question, but "How old are the students in my school?" is a statisticical question because one anticipates variability in
students' 2 ages.
6.SP.A.2: Understand that a set of data collected to answer a statistical question ha a distribution which can be described by its center, spread, and overal
shape. shape.
s.
3.
6.SP.A.3: Recognize that a measure of center for a numerical data set summarizes how its values vary with a single number
Summarize and describe distributions.
on a number line, including dot plots,
6.SP.B.4. Display numerical adata
histograms, and box plots.
6.SP.B.5: Summarize numerical data sets in relation to their context, such as by
a. Reporting the number of observations.
b. Describing the nature of the attribute under investigation, including how was measured and its units of measurement.
c. Giving quantitative measures of center (median and/or mean) and variabiity (interquartile range and/or mean absolute deviation), as well
as describing any overall pattern and any striking deviations from the overall pattern with reference to the context in which the data were gathered.
d. Relating the choice of measures of center and variability to the shape of

## Mathematical Practices

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.

Construct viable arguments
5. Use appropriate tools strategically.
6. Attend to precision.
. Look for and make use of structure
Look for and express regularity in repeated reasoning.

Developing understanding of and applying proportional relationships - Students extend their understanding of ratios and develop understanding of
proporiionality to solve single- and mult-step problems. Students use their understanding of ratios and propotionality to solve a wide variety of percent problems, including those involving discounts, interest, taxes, tips, and percent increase or decrease. Students solve problems about scale drawings by relating corresponding lengths between the objects or by using
the fact that relationships of lengths within an object are preserved in similar objectis. Students graph proportional relationships and understand the unit rate informally as a measure of the steepness of the related line, called the
slope. They distinguish proportional relationships from other relationships.
2. Developing understanding of operations with rational numbers and
working with expressions and linear equations

- Students develop a unified understanding of number, recognizing fractions percents as different representations of rational numbers. Students extend addition, subtraction, multiplication, and division to all rational numbers, maintaining the properties of operations and the relationships between addition and subbraction, and multificacaion and division. By applying these (e.g., amounts owed or temperatures below zero), students explain and interpret the rules for adding, subtracting, multiplying, and dividing with negative numbers. They use the arithmetic of rational numbers as the formulate expressions and eq
equations to solve problems.
Solving problems involving scale drawings and informal geometric constructions, and working with two- and three-dimensional shapes to solve problems involving area, surface area, and volume
Students continue their work with area from Grade 6 , solving problems dimensional objects. In creparation for work on and surface area of threeGrade 8 they reason about relationships among two-dimensional figures using scale drawings and informal geometric constructions, and they gain lamiliarity with the relationships between angles formed by intersecting lines. Students work with three-dimensional figures, reating them to two-
dimensional figures by examining cross-sections. They solve real-world and mathematical problems involving area, surface area, and volume of twoand three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes and right prisms.
Drawing inferences about populations based on samples
Students build on their previous work with single data distributions to compare wo dala distributions and address questions about differences generate data sets and learn about the importance of representative samples for drawing inferences.
atio and Proportional Relationships - Analyze proportional relationships and inem to solve real-world and mathematical problems,
.RP.A.1: Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quartities measured in like or different units. For example, if a person walks $1 / 2$ mile in each $1 / 4$ hour, compute the unit rate as
RPA.2: Recognize and represent proportional relationships between quantities.
a. Decide whether two quantities are in a proportional relationship, e.g., by testing for equivalentross in a table or graphing on a coor mate
and observing whether the graph is a straight line through the origin
b. Identify the constant of proportionality (unit rate) in tables, graphs equations, diag
relationships.
c. Represent proportional relationships by equations. For example if total costt is proportional to the number nof items purchased at number of items can be expressed as $t=p n$.
d. Explain what a point ( $x, y$ ) on the graph of a proportional relationship 0 ) and $(1, r)$ where $r$ is the unit $r$ te
7.RP.A.3: Use proportional relationships to solve multistep ratio and percent oblems. Examples: simple interest, tax, markups and markdowns, gratuitie nd commissions, fees, percent increase and decrease, percent error
The Number System - Apply and extend previous understandings of operations racions to add, subtract, multiply, and divide rational numbers,
7.NS.A.1: Apply and extend previous understandings of addition and subtraction to add and subtract rational numbers; represe
horizontal or vertical number line diagram.
a. Describe situations in which opposite quantities combine to make 0 For example, a hydrogen atom has 0 charge because its two
constituents are oppositely charged.
b. Understand $p+q$ as the number located a distance $|q|$ from $p$, in the positive or negative direction depending on whether $q$ is positive or
negative. Show that a number and its opposite have a sum of 0 ( negative. Show that a number and its opposite have a sum of 0 (are
additive inverses). Interpet sums of rational numbers by describing adative inverses). It
real-world contexts.
c. Understand subtraction of rational numbers as adding the additive inverse, $p-q=p+(-q)$. Show that the distance between two rational numbers on the number line is the absolute va
and apply this
d. Apply properties of operations as strategies to add and subbrac
.NS.A.Z: Apply and extend previous understandings of multiplication and division and of fractions to multiply and divide rational number
a. Understand that multipication is extended from fractions to rational numbers by requiring that operations continue to satisfy the properties
of operations, particularyy the distributive property, leading to products such as $(-1)(-1)=1$ and the rules for muttiplying signed numbers
. Interpret products of rational numbers by describing real-world
contexts.
b. Understand that integers can be divided, provided that the divisor is not zero, and every guotient of integesrs (with hon--zero divisor) is a
rational number. If $p$ and $q$ are integers , hen $-p(q)=(-p / 1)=p(-q)$ rational number. If $p$ and $q$ are integers, then $-(p / q)=(-p) q=p /(-q)$. contexts.
c. Apply properties of operations as strategies to multiply and divide
d. Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0 s or eventually repeats.
7.NS.A.3: Solve real-world and mathematical problems involving the four operations
with rational numbers. (NOTE: Computations formin

Expressions and Equations - Use properties of operations to generate equivalent expressions.
7.EE.A.1: Apply properties of operations as strategies to add, subtract, factor, and 7.
7.EE.A.2: Understand that rewititing an expression in different forms in a problem related. For example a $+0.05 a=1.05$ a means that "increase by $5 \%$ " the same as "multiply by 1.05 ."
Solve real-life and mathematical problems using numerical and algebraic
expressions and equations.
7.EE.B.3: Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and
decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as approp and assess the reasonablenyss of answers using mental computation and
$10 \%$ raise, she will make an addilitional 1110 of her salary an hour, or inches long in the center of a door that is $271 / 2$ inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.
7.EE.B.4: Use variables to represent quantities in a real-world or mathematica problem, and construct simple equations and reasoning about the quantities.
. Solve word problems leading to equations of the form $p x+q=r$ and $p(x$ $+q)=r$, where $p, q$, and $r$ rare specific rational numbers. Solve
equations of these forms fluenty. Compare an algebraic solution to an
 each approach. For example, the pe
Its length is 6 cm . What is is width?
Solve word problems leading to inequalities of the form $p x+q>$ ror $p x$
$+q<r$, where $p$, $q$, and $r$ rare specific rational numbers. Graph the $+q<\tau$, where $p, q$, and
solution set of the inequality and interprete it in the context of the problem. For example: As a salesperson, you ra e paid $\$ 50$ per week
pus $\$ 3$ per sale. This week you want pour pay to be at east $\$ 100$ plus $\$ 3$ per sale. This week you want your pay to be at least $\$ 100$.
Write an inequality for the number of sales you need to make, and describe the solutions.
Geometry - Draw, construct, and describe geometrical figures and describe the elationships between them.
7.G.A.1: Solve problems involving scale drawings of geometric figures, including computing actual lengths and area
7.G.A.2: Draw (freehand, with ruler and protractor, and with technology) geometric shapes with given conditions. Focus on constructing triangles from thre measures of angles or sides, noticing when the congle
7.G.A.3: Describe the two-dimensional figures that result from slicing threeDescribe the two-dimensional figures that result from slicing threeight rectangular pyramids.
Solve real-life and mathematical problems involving angle measure, area, surface area, and volume.
7.G.B.4: Know the formulas for the area and circumference of a circle and use between the circumference and area of a circle.
7.G.B.5: Use facts about supplementary, complementary, vertical, and adiacent angles in a multi-step problem to write and solve simple equations for an nknown angle in a figure.
7.G.B.6: Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadriaterals, polygons, cubes, and right prisms
Statistics and Probability - Use random sampling to draw inferences about population.
.SP.A.1: Understand that statistics can be used to gain information about a popuation by examining a sample of the population; generalizazions about hat population. Understand that random sampling tends to produce epresentative samples and support valid inferences.
7.SP.A.2: Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates
predictions. For example, estimate the mean word length in a book by randomly sampling words sfrom the book; predict the winner of a school election based on rardsomly sampled survey data. Gauge how far off the
estimate or prediction might be.
Draw informal comparative inferences about two populations.
7.SP.B.3: Informally assess the degree of visual overlap of two numerical data Centers by expressing it as a multiple of a measure of variability. For
example, the mean height of players on the basketball team is 10 cm the variabilty ( an absute deviation) on either team. on a dot plot the the variability (mean absolute deviation) on either team; on a dot plat
separation between the two distributions of heights is noticeable.
Se measures of center and measures of variability for numerical data
from random samples to draw informal comporative inferences about two populations. For example, decide whether the words in a chapter of a chapter of a fourth-grade science book.
nvestig
.SP.C.5: Understand that the probability of a chance event is a number between 0 and 1 that exppersses the likelihooo dof the evennt occurring. .argee
numbers indicate greater likelihood. A probability near 0 indicates numbers indicate greater likelihood. A probabiilty near 0 indicates an unikely event, a probability around 122 indicates an event that is neit
unlikely nor likely, and a probability near 1 indicates a likely event.
.SP.C.6: Approximate the probability of a chance event by collecting data on tie chance process that producces it and dobserving its ologn-run realitive
frequency. and predict the approximate ellative frequency given the frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict
that a 30 or 6 would be rolled roughly 200 times, but probably not exactly 200 times.
7.SP.C.7: Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequenciess if the
agreement is no good, explain possible sources of the discrepancy.
a. Develop a uniform probability model by assigning equal probability to For example, if a student is selected at random from a class, find the probability that Jane will be selected and the probability that a girl will be selected.
b. Develop a probability model (which may not be uniform) by observing find the approximate probability that a spinning penny. will land heads up or the approximatate probsability that a spinning penny will land and outcomes for the spinning penny appear to be equally likely based on the observed frequencies?
7.SP.C.8: Find probabilities of compound events using organized lists, tables, tree
diagrams, and simulation.
a. Understand that, just as with simple events, the probability of a compound event is the fraction of of
which the compound event occurs.
b. Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., "rolling double sixes"), identify the outcome the sample space which compose the even.
c. Design and use a simulation to generate frequencies for compound approximate the answer to the question: If $40 \%$ of donors have type $A$ approximate the answer to the question: If 40\% of donors have type
blood, what is the probability that ti will take at least 4 donors to find
one with type A blood?

## Mathematical Practices

. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively

Construct viable arguments and critique the reasoning of others.
Model with mathematics.
5. Use appropriate tools strategically.

Attend to precision.
ake use of structure.
Look for and express regularity in repeated reasoning.
. Formulating and reasoning about expressions and equations, including modeling an association in bivariate data with a line equation, and solving linear equations and systems of linea

- Students use linear equations and systems of linear equations to represent, analyze, and solve a variety of problems. Students recognize
equations for proportions $(y y x=m$ or $y=m x)$ ss special linear equation $(y=m x+b)$, understanding that the constant of proportionality ( $m$ ) is the slope, and the graphs are lines through the origin. They understand that the slope ( $m$ ) of a line is a constant rate of change, so that if the input or $x$-coordinate changes by an amount $A$, the output or $y$ -
coordinate changes by the amount $m \cdot A$. Students also use a linea equation to describe the association between two quantities in bivaria data (such as arm span vs. height for students in a classroom). At this grade, fitting the model, and assessing its fit to the data are done informally. Interpreting the model in the context of the data requires students to express a relationship between the two quantites in and $y$-intercept) in terms of the situation.
- Students strategically choose and efficiently implement procedures to use the properties of equality and the concept of logical equivalence, they maintain the solutions of the original equation. Students solve systems of two linear equations in two variables and relate the systems to pairs of lines in the plane; these intersect, are parallel, or are the same line. Students use linear equations, systems of linear equations,
linear functions, and their understanding of slope of a line to analyze situations and solve problems.

2. Grasping the concept of a function and using functions to describe quantitative relationships

- Students grasp the concept of a function as a rule that assigns to each input exactly one output. They understand that functions describe among representations and partial representations of functions (noting that tabular and graphical representations may be partial representations), and they describe how aspects of the function are
reflected in the different representations.

3. Analyzing two- and three-dimensional space and figures using distance, angle, similarity, and congruence, and understanding and

- Students use ideas about distance and angles, how they behave under translations, rotations, reflections, and dilations, and ideas about congruence and similarity to describe and analyze two-dimensional angles in a triangle is the angle formed by a straight line, and that various configurations of lines give rise to similar triangles because of the angles created when a transversal cuts parallel lines. Students understand the statement of the Pythagorean Theorem and its converse, and can explain why the Pythagorean Theorem holds, for
example, by decomposing a square in two different ways. The, apply the Pythagorean Theorem to find distances between points on the coordinate plane, to find lengths, and to analyze polygons. Students complete their work on volume by solving problems involving cones, cylinders, and spheres.
The Number System - Know that there are numbers that are not rational, and approximate them by rational numbers.
8.NS.A.1: Understand informally that every number has a decimal expansion; the rational numbers are those with decimal expansions that terminate Os or eventually repeat. Know that other numbers are called irrational.
8.NS.A.2: Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number lis , 1 , example, by runcaing is between 1 and 2 then between 1.4 and 1.5 and explain how to continue on to get better approximations.
Expressions and Equations - Work with radicals and integer exponents.
8.EE.A.1: Know and apply the properties of integer exponents to generate equivalent numerical expressions. For example, $3^{2} \times 3^{-5}=3^{-3}=1 / 3^{3}=$ $1 / 27$.
8.EE.A.2: Use square root and cube root symbols to represent solutions to equations of the form $x^{2}=p$ and $X^{3}=p$, where $p$ is a positive rational of small perfect cubes. Know that $\sqrt{2}$ is irrational
8.EE.A.3: Use numbers expressed in the form of a single digit times an intege power of 10 to estimate very large or very small quantities, and to xpress how many mes as . United States as $3 \times 10^{8}$ and the population of the world as $7 \times 10^{9}$, and determine that the world population is more than 20 times larger.
8.EE.A.4 : Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation
that has been generated by technology.
Understand the connections between proportional relationships, lines, and linear equations.
8.EE.B.5: Graph proportional relationships, interpreting the unit rate as the slope of the graph. Compare two different proportional relationships represented in different ways. For example, compare a distance-time
graph to a distance-time equation to determine which of two moving objects has greater speed.
8.EE.B.6: Use similar triangles to explain why the slope $m$ is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation $y=m x$ for a line through the origin and the equation $y=m x+b$ for a line intercepting the vertical axis at $b$,
Analyze and solve linear equations and pairs of simultaneous linear equations.
8.EE.C.7: Solve linear equations in one variabe
a. Give examples of linear equations in one variable with one solution infinitely many solutions, or no solutions. Show which of these equation into simpler forms, until an equivalent equation of the form $x=a, a=a$, or $a=b$ results (where $a$ and $b$ are different numbers).
b. Solve linear equations with rational number coefficients, including equations whose solutions require expanding ex
the distributive property and collecting like terms.
8.EE.C.8: Analyze and solve pairs of simultaneous linear equations.
a. Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously
b. Solve systems of two linear equations in two variables algebraically, and estimate solutions by graphing the equations.
$2 y=6$ have no solution because $3 x+2 y$ cannot simultaneously be 5 and 6 .
c. Solve real-world and mathematical problems leading to two linear equations in two variabies. For example, given coordinates for two points intersects the line through the second pair.

## Functions - Define, evaluate, and compare functions.

8.F.A.1: Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs nsisting of an mpured in Grade esponding output. (Note: Function notaion is not tequired in Grade 8.)
8.F.A.2: Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal able of values and a linear function represented by an algebraic expression, determine which function has the greater rate of change.
8.F.A.3: Interpret the equation $y=m x+b$ as defining a linear function, whose graph is a straight line; give examples of functions that are not linear. For example, the function $A=s^{2}$ giving the area of a square as a function of its side length is not linear because its graph contains the
sse functions to model relationships between quantities,
8.F.B.4: Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two $(x, y)$ values, including eading these from a table or fiom a graph. Interpreet he rate of chang nd initial value of a linear func arms of the situation it models, and in terms of its graph or a table of values.
8.F.B.5: Describe qualitatively the functional relationship between two quantitie by analyzing a graph (e.g., where the function is increasing or
decreasing linear or qualitative features of a function that has been described verbally.
Geometry - Understand congruence and similarity using physical models, ransparencies, or geometry software
B.G.A.1: Verify experimentally the properties of rotations, reflections, and translations:
a. Lines are taken to lines, and line segments to line segments of the same length.
b. Angles are taken to angles of the same measure,
c. Parallel lines are taken to parallel lines
8.G.A.2: Understand that a two-dimensional figure is congruent to another if the second can be obtained from the first by a sequence of rotations, eflections, and translations; given two congruent figu
8.G.A.B: Describe the effect of dilations, translations, rotations, and reflections on two-dimensional figures using coordinates.
8.G.A.4: Understand that a two-dimensional figure is similar to another if the second can be obtained from the first by a sequence of rotations, second can be obtained from the first by a sequence of rotaio
reflections, translations, and dilations; given two similar twodimensional figures, describe a sequence that exhibits the similarity
between them.
8.G.A.5: Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parailel lines cut by a transversal, and the angle-angle criterion for similarity of
triangles. For example, arrange three copies of the same triangle so that he sum argument in terms of transversals why this is so.
Understand and apply the Pythagorean Theorem.
8.G.B.6: Explain a proof of the Pythagorean Theorem and its converse.
8.G.B.7: Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and thre dimensions.
8.G.B.8: Apply the Pythagorean Theorem to find the distance between two points in a coordinate system.
Solve real-world and mathematical problems involving volume of cylinders, ones, and spheres.
G.C.9: Know the formulas for the volumes of cones, cylinders, and sphere and use them to solve real-world and mathematical proble

Statistics and Probability - Investigate patterns of association in bivariate
.SP.A.1: Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns suchias and in
.SP.A.2 : Know that straight lines are widely used to model relationship between two quantitative variables. For scatter plots that suggest a
linear association informally fit a straight ine and informally assess th model fit by judging the closeness of the data points to the line.
8P.A.3: Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. For example, in a linear model for a biology experiment, interpret a slope of $1.5 \mathrm{~cm} / \mathrm{hr}$ as meaning that an additional hour of sunlight each day is associated with an additional 1.5 cm in mature plant height.
8.SP.A.4: Understand that patterns of association can also be seen in bivariate categorical data by displaying frequencies and relative frequencies in a two-way table. Construct and interpret a two-way table summarizing data on Iwo categorical variables collected from the same subjects. Use realive frequencies calculated for rows or columns to describe
possible association between the two variables. For example, collect data from students in your class on whether or not they have a curfew on school nights and whether or not they have assigned chores at have chores?

## Mathematical Practice

Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
. Construct viable arguments and critique the reasoning of others.
. Model with mathematics.
5. Use appropriate tools strategically.

Attend to precision.
use of structure
Look for and express regularity in repeated reasoning

## Numbers and Number Systems

 to generate data for numerical experiments, to help understand the workings of matrix, vector, and complex number algebra, and to experiment with non-integer exponents.

## Quantities

 evaporation. Quantification is also important for companies, which must conceptualize relevant attributes and create or choose suitable measures for them.

## Vector and Matrix Quantities N-VM

A. Represent and model with vector quantities

N-VM.A.1. (+) Recognize vector quantities as having both magnitude and direction. Represent vector quantities by directed line segments, and use appropriate symbols for vectors and their magnitudes (e.g., $\boldsymbol{v},|\boldsymbol{v}|,\|\boldsymbol{v}\|, v)$.
N-VM.A.2. (+) Find the components of a vector by subtracting the coordinates of an initial point from the coordinates of a terminal point.
N-VM.A.3. (+) Solve problems involving velocity and other quantities that can be represented by vectors.
B. Perform operations on vectors

N-VM.B.4. (+) Add and subtract vectors
a. Add vectors end-to-end, component-wise, and by the parallelogram rule. Understand that the magnitude of a sum of two vectors is typically not the sum of the magnitudes.
b. Given two vectors in magnitude and direction form, determine the magnitude and direction of their sum.
c. Understand vector subtraction $\boldsymbol{v}-\boldsymbol{w}$ as $\boldsymbol{v}+(-\boldsymbol{w})$, where $\boldsymbol{-} \boldsymbol{w}$ is the additive inverse of $\boldsymbol{w}$, with the same magnitude as $\boldsymbol{w}$ and pointing in the opposite direction. Represent vector subtraction graphically by connecting the tips in the appropriate order, and perform vector subtraction component-wise
N-VM.B.5. (+) Multiply a vector by a scalar
a. Represent scalar multiplication graphically by scaling vectors and possibly reversing their direction; perform scalar multiplication component-wise, e.g., as $c\left(v_{x}, v_{y}\right)=\left(c v_{x}, c v_{y}\right)$.
b. Compute the magnitude of a scalar multiple $c v$ using $\|c v\|=|c| v$. Compute the direction of $c v$ knowing that when $|c| v \neq 0$, the direction of $c v$ is either along $\boldsymbol{v}$ (for $c>0$ ) or against $\boldsymbol{v}$ (for $c<0$ ).
C. Perform operations on matrices and use matrices in applications.

N-VM.C.6. (+) Use matrices to represent and manipulate data, e.g., to represent payoffs or incidence relationships in a network.
N-VM.C.7. (+) Multiply matrices by scalars to produce new matrices, e.g., as when all of the payoffs in a game are doubled.
N-VM.C.8. (+) Add, subtract, and multiply matrices of appropriate dimensions.
N-VM.C.9. (+) Understand that, unlike multiplication of numbers, matrix multiplication for square matrices is not a commutative operation, but still satisfies the associative and distributive properties N-VM.C.10. (+) Understand that the zero and identity matrices play a role in matrix addition and multiplication similar to the role of 0 and 1 in the real numbers. The determinant of a square matrix is nonzero if and only if the matrix has a multiplicative inverse.
N-VM.C.11. (+) Multiply a vector (regarded as a matrix with one column) by a matrix of suitable dimensions to produce another vector. Work with matrices as transformations of vectors.
N-VM.C.12. (+) Work with $2 \times 2$ matrices as transformations of the plane, and interpret the absolute value of the determinant in terms of area.

N-CN.C.7. Solve quadratic equations with real coefficients that have complex solutions. N-CN.C.8. (+) Extend polynomial identities to the complex numbers. For example, rewrite $x^{2}+4$ as $(x+2 i)(x-2 i)$.
N-CN.C.9. (+) Know the Fundamental Theorem of Algebra; show that it is true for quadratic
polynomials.

## HS Conceptual Category: Algebra

## Expressions

An expression is a record of a computation with numbers, symbols that represent numbers, arithmetic operations, exponentiation, and, at more advanced levels, the operation of evaluating a function. Conventions about the use of parentheses and the order of operations assure that each expression is unambiguous. Creating an expression that describes a computation involving a general quantity requires the ability to express the computation in general terms, abstracting from specific instances. Reading an expression with comprehension involves analysis of its underlying structure. This may suggest a different but equivalent way of writing the expression that exhibits some different aspect of its meaning. For example, $p+0.05 p$ can be interpreted as the addition of a $5 \%$ tax to a price $p$. Rewriting $p+0.05 p$ as $1.05 p s h o w s$ that adding a tax is the same as multiplying the price by a constant factor. Algebraic manipulations are governed by the properties of operations and exponents, and the conventions of algebraic notation. At times, an expression is the result of applying operations to simpler expressions. For example, $p+0.05 p$ is the sum of the simpler expressions $p$ and $0.05 p$. Viewing an expression as the result of operation on simpler expressions can sometimes clarify its underlying structure. A spreadsheet or a computer algebra system (CAS) can be used to experiment with algebraic expressions, perform complicated algebraic manipulations, and understand how algebraic manipulations behave.

## Equations and inequalities

An equation is a statement of equality between two expressions, often viewed as a question asking for which values of the variables the expressions on either side are in fact equal. These values are the solutions to the equation. An identity, in contrast, is true for all values of the variables; identities are often developed by rewriting an expression in an equivalent form. The solutions of an equation in one variable form a set of numbers; the solutions of an equation in two variables form a set of ordered pairs of numbers, which can be plotted in the coordinate plane. Two or more equations and/or inequalities form a system. A solution for such a system must satisfy every equation and inequality in the system. An equation can often be solved by successively deducing from it one or more simpler equations. For example, one can add the same constant to both sides without changing the solutions, but squaring both sides might lead to extraneous solutions. Strategic competence in solving includes looking ahead for productive manipulations and anticipating the nature and number of solutions. Some equations have no solutions in a given number system, but have a solution in a larger system. For example, the solution of $x+1=0$ is an integer, not a whole number; the solution of $2 x+1=0$ is a rational number, not an integer; the solutions of $x 2-2=0$ are real numbers, not rational numbers; and the solutions of $x 2+2=0$ are complex numbers, not real numbers. The same solution techniques used to solve equations can be used to rearrange formulas. For example, the formula for the area of a trapezoid, $A=((b 1+b 2) / 2) h$, can be solved for $h$ using the same deductive process. Inequalities can be solved by reasoning about the properties of inequality. Many, but not all, of the properties of equality continue to hold for inequalities and can be useful in solving them.

## Connections to Functions and Modeling

Expressions can define functions, and equivalent expressions define the same function. Asking when two functions have the same value for the same input leads to an equation; graphing the two functions allows for finding approximate solutions of the equation. Converting a verbal description to an equation,
inequality, or system of these is an essential skill in modeling.

## Arizona College and Career Ready Standards - Mathematics - High School Placemats

## Seeing Structure in Expressions A-SSE

A. Interpret the structure of expressions

A-SSE.A.1. Interpret expressions that represent a quantity in terms of its context. $\star$
a. Interpret parts of an expression, such as terms, factors, and coefficients.
b. Interpret complicated expressions by viewing one or more of their parts as a single entity. For example, interpret $P(1+r) n$ as the product of $P$ and a factor not depending on $P$.
A-SSE.A.2. Use the structure of an expression to identify ways to rewrite it. For example, see $x^{4}-y^{4}$ as $\left(x^{2}\right)^{2}$ $-\left(y^{2}\right)^{2}$, thus recognizing it as a difference of squares that can be factored as $\left(x^{2}-y^{2}\right)\left(x^{2}+y^{2}\right)$.
B. Write expressions in equivalent forms to solve problems

A-SSE.B.3. Choose and produce an equivalent form of an expression to reveal and explain properties of the quantity represented by the expression. $\star$
a. Factor a quadratic expression to reveal the zeros of the function it defines
b. Complete the square in a quadratic expression to reveal the maximum or minimum value of the function it defines.
c. Use the properties of exponents to transform expressions for exponential functions. For example the expression $1.15^{t}$ can be rewritten as $\left(1.15^{1 / 12}\right)^{12 t} \approx 1.012^{12 t}$ to reveal the approximate equivalent monthly interest rate if the annual rate is $15 \%$.
A-SSE.B.4. Derive the formula for the sum of a finite geometric series (when the common ratio is not 1 ), and use the formula to solve problems. For example, calculate mortgage payments. $\star$

## Arithmetic with Polynomials and Rational Expressions A-APR

## A. Perform arithmetic operations on polynomial

A-APR.A.1. Understand that polynomials form a system analogous to the integers, namely, they are closed under the operations of addition, subtraction, and multiplication; add, subtract, and multiply polynomials B. Understand the relationship between zeros and factors of polynomials

A-APR.B.2. Know and apply the Remainder Theorem: For a polynomial $p(x)$ and a number $a$, the remainder on division by $x-a$ is $p(a)$, so $p(a)=0$ if and only if $(x-a)$ is a factor of $p(x)$
A-APR.B.3. Identify zeros of polynomials when suitable factorizations are available, and use the zeros to construct a rough graph of the function defined by the polynomial.
C. Use polynomial identities to solve problems

A-APR.C.4. Prove polynomial identities and use them to describe numerical relationships. For example, the polynomial identity $\left(x^{2}+y^{2}\right)^{2}=\left(x^{2}-y^{2}\right)^{2}+(2 x y)^{2}$ can be used to generate Pythagorean triples. A-APR.C.5. (+) Know and apply the Binomial Theorem for the expansion of $(x+y)^{n}$ in powers of $x$ and $y$ for a positive integer $n$, where $x$ and $y$ are any numbers, with coefficients determined for example by Pascal's Triangle.
D. Rewrite rational expressions

A-APR.D.6. Rewrite simple rational expressions in different forms; write $a(x) / b(x)$ in the form $q(x)+r(x) / b(x)$ where $a(x), b(x), q(x)$, and $r(x)$ are polynomials with the degree of $r(x)$ less than the degree of $b(x)$, using inspection, long division, or, for the more complicated examples, a computer algebra system.
A-APR.D.7. (+) Understand that rational expressions form a system analogous to the rational numbers, closed under addition, subtraction, multiplication, and division by a nonzero rational expression; add, subtract, multiply, and divide rational expressions

## Creating Equations A-CED

A. Create equations that describe numbers or relationships

A-CED.A.1. Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic functions, and simple rational and exponential functions.

A-CED.A.2. Create equations in two or more variables to represent relationships between quantities; graph equations on coordinate axes with labels and scales.
A-CED.A.3. Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret solutions as viable or nonviable options in a modeling context. For example, represent inequalities describing nutritional and cost constraints on combinations of different foods.
A-CED.A.4. Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. For example, rearrange Ohm's law $V=I R$ to highlight resistance $R$.

## Reasoning with Equations and Inequalities A-REI

A. Understand solving equations as a process of reasoning and explain the reasoning

A-REI.A.1. Explain each step in solving a simple equation as following from the equality of numbers asserted at the previous step, starting from the assumption that the original equation has a solution. Construct a viable argument to justify a solution method.
A-REI.A.2. Solve simple rational and radical equations in one variable, and give examples showing how extraneous solutions may arise.
B. Solve equations and inequalities in one variable

A-REI.B.3. Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters.
A-REI.B.4. Solve quadratic equations in one variable
a. Use the method of completing the square to transform any quadratic equation in $x$ into an equation of the form $(x-p)^{2}=\mathrm{q}$ that has the same solutions. Derive the quadratic formula from this form.
b. Solve quadratic equations by inspection (e.g., for $x^{2}=49$ ), taking square roots, completing the square, the quadratic formula and factoring, as appropriate to the initial form of the equation. Recognize when the quadratic formula gives complex solutions and write them as $a \pm b i$ for real numbers $a$ and $b$.
C. Solve systems of equations

A-REI.C.5. Prove that, given a system of two equations in two variables, replacing one equation by the sum of that equation and a multiple of the other produces a system with the same solutions.
A-REI.C.6. Solve systems of linear equations exactly and approximately (e.g., with graphs), focusing on pairs of linear equations in two variables.
A-REI.C.7. Solve a simple system consisting of a linear equation and a quadratic equation in two variables algebraically and graphically. For example, find the points of intersection between the line $y=-3 x$ and the circle $x^{2}+y^{2}=3$.
A-REI.C.8. (+) Represent a system of linear equations as a single matrix equation in a vector variable.
A-REI.C.9. (+) Find the inverse of a matrix if it exists and use it to solve systems of linear equations (using technology for matrices of dimension $3 \times 3$ or greater).
D. Represent and solve equations and inequalities graphically

A-REI.D.10. Understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane, often forming a curve (which could be a line),
A-REI.D.11. Explain why the $x$-coordinates of the points where the graphs of the equations $y=f(x)$ and $y=$ $g(x)$ intersect are the solutions of the equation $f(x)=g(x)$; find the solutions approximately, e.g., using echnology to graph the functions, make tables of values, or find successive approximations. Include cases where $f(x)$ and/or $g(x)$ are linear, polynomial, rational, absolute value, exponential, and logarithmic
functions. $\star$
A-REI.D.12. Graph the solutions to a linear inequality in two variables as a half-plane (excluding the boundary in the case of a strict inequality), and graph the solution set to a system of linear inequalities in two variables as the intersection of the corresponding half-planes.

 functions, including recursively defined functions.

## Connections to Expressions, Equations, Modeling, and Coordinates

 Sometimes functions are defined by a recursive process, which can be displayed effectively using a spreadsheet or other technology.

## Arizona College and Career Ready Standards - Mathematics - High School Placemats

## Interpreting Functions F-IF

A. Understand the concept of a function and use function notation

F-IF.A.1. Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If $f$ is a function and $x$ is an element of its domain, then $f(x)$ denotes the output of $f$ corresponding to the input $x$. The graph of $f$ is the graph of the equation $y=f(x)$.
F-IF.A.2. Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.
F-IF.A.3. Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. For example, the Fibonacci sequence is defined recursively by $f(0)=f(1)=1, f(n+1)=f(n)+f(n-1)$ for $n \geq 1$.
B. Interpret functions that arise in applications in terms of the context

F-IF.B.4. For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity. $\star$
F-IF.B.5. Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. For example, if the function $h(n)$ gives the number of person-hours it takes to assemble $n$ engines in a factory, then the positive integers would be an appropriate domain for the function. $\star$
F-IF.B.6. Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph. $\star$
C. Analyze functions using different representations

F-IF.C.7. Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using technology for more complicated cases. $\star$
a. Graph linear and quadratic functions and show intercepts, maxima, and minima
b. Graph square root, cube root, and piecewise-defined functions, including step functions and absolute value functions.
c. Graph polynomial functions, identifying zeros when suitable factorizations are available, and showing end behavior.
d. (+) Graph rational functions, identifying zeros and asymptotes when suitable factorizations are available, and showing end behavior.
e. Graph exponential and logarithmic functions, showing intercepts and end behavior, and trigonometric functions, showing period, midline, and amplitude.
F-IF.C.8. Write a function defined by an expression in different but equivalent forms to reveal and explain different properties of the function
a. Use the process of factoring and completing the square in a quadratic function to show zeros, extreme values, and symmetry of the graph, and interpret these in terms of a context.
b. Use the properties of exponents to interpret expressions for exponential functions. For example, identify percent rate of change in functions such as $y=(1.02)^{\mathrm{t}}, y=(0.97)^{\mathrm{t}}, y=(1.01)^{12 \mathrm{t}}, y=(1.2)^{\mathrm{tr10}}$, and classify them as representing exponential growth or decay.
F-IF.C.9. Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a graph of one quadratic function and an algebraic expression for another, say which has the larger maximum.

## Building Functions F-BF

A. Build a function that models a relationship between two quantities

F-BF.A.1. Write a function that describes a relationship between two quantities. $\star$
a. Determine an explicit expression, a recursive process, or steps for calculation from a context.
b. Combine standard function types using arithmetic operations. For example, build a function that models the temperature of a cooling body by adding a constant function to a decaying exponential, and relate these functions to the model.
c. (+) Compose functions. For example, if $T(y)$ is the temperature in the atmosphere as a function of height, and $h(t)$ is the height of a weather balloon as a function of time, then $T(h(t))$ is the temperature at the location of the weather
balloon as a function of time.
F-BF.A.2. Write arithmetic and geometric sequences both recursively and with an explicit formula, use them to model situations, and translate between the two forms. $\star$
B. Build new functions from existing functions

F-BF.B.3. Identify the effect on the graph of replacing $f(x)$ by $f(x)+k, k f(x), f(k x)$, and $f(x+k)$ for specific values of $k$ (both positive and negative); find the value of $k$ given the graphs. Experiment with cases and illustrate an explanation of the effects on the graph using technology. Include recognizing even and odd functions from their graphs and algebraic expressions for them.
F-BF.B.4. Find inverse functions.
a. Solve an equation of the form $f(x)=c$ for a simple function $f$ that has an inverse and write an expression for the inverse. For example, $f(x)=2 x^{3}$ or $f(x)=(x+1) /(x-1)$ for $x \neq 1$.
b. ( + ) Verify by composition that one function is the inverse of another.
c. (+) Read values of an inverse function from a graph or a table, given that the function has an inverse.
d. (+) Produce an invertible function from a non-invertible function by restricting the domain.

F-BF.B.5. (+) Understand the inverse relationship between exponents and logarithms and use this relationship to solve problems involving logarithms and exponents.

## Linear, Quadratic, and Exponential Models $\star$ F-LE

## A. Construct and compare linear, quadratic, and exponential models and solve problems

F-LE.A.1. Distinguish between situations that can be modeled with linear functions and with exponential functions.
a. Prove that linear functions grow by equal differences over equal intervals, and that exponential functions grow by equal factors over equal intervals.
b. Recognize situations in which one quantity changes at a constant rate per unit interval relative to another
c. Recognize situations in which a quantity grows or decays by a constant percent rate per unit interval relative to another
F-LE.A.2. Construct linear and exponential functions, including arithmetic and geometric sequences, given a graph, a description of a relationship, or two input-output pairs (include reading these from a table).
F-LE.A.3. Observe using graphs and tables that a quantity increasing exponentially eventually exceeds a quantity increasing linearly, quadratically, or (more generally) as a polynomial function.
F-LE.A.4. For exponential models, express as a logarithm the solution to $a b^{c t}=d$ where $a, c$, and $d$ are numbers and the base $b$ is 2,10 , or $e$; evaluate the logarithm using technology.
B. Interpret expressions for functions in terms of the situation they model

F-LE.B.5. Interpret the parameters in a linear or exponential function in terms of a context.

## Trigonometric Functions F-TF

A. Extend the domain of trigonometric functions using the unit circle

F-TF.A.1. Understand radian measure of an angle as the length of the arc on the unit circle subtended by the angle. F-TF.A.2. Explain how the unit circle in the coordinate plane enables the extension of trigonometric functions to all real numbers, interpreted as radian measures of angles traversed counterclockwise around the unit circle.
F-TF.A.3. (+) Use special triangles to determine geometrically the values of sine, cosine, tangent for $\pi / 3$, $\pi / 4$ and $\pi / 6$, and use the unit circle to express the values of sine, cosine, and tangent for $\pi-x, \pi+x$, and $2 \pi-x$ in terms of their values
for $x$, where $x$ is any real number.
F-TF.A.4. (+) Use the unit circle to explain symmetry (odd and even) and periodicity of trigonometric functions.
B. Model periodic phenomena with trigonometric functions

F-TF.B.5. Choose trigonometric functions to model periodic phenomena with specified amplitude, frequency, and midline. $\star$
F-TF.B.6. (+) Understand that restricting a trigonometric function to a domain on which it is always increasing or always decreasing allows its inverse to be constructed.
F-TF.B.7. (+) Use inverse functions to solve trigonometric equations that arise in modeling contexts; evaluate the solutions using technology, and interpret them in terms of the context. $\star$
C. Prove and apply trigonometric identities

F-TF.C.8. Prove the Pythagorean identity $\sin ^{2}(\theta)+\cos ^{2}(\theta)=1$ and use it to find $\sin (\theta), \cos (\theta)$, or $\tan (\theta)$ given $\sin (\theta)$, $\cos (\theta)$ or $\tan (\theta)$ and the quadrant of the angle
F-TF.C.9. (+) Prove the addition and subtraction formulas for sine, cosine, and tangent and use them to solve problems

Arizona College and Career Ready Standards - Mathematics - High School Placemats

HS Conceptual Category: Modeling (denoted with a star $\star$ )

| Domains Clusters | Modeling is best interpreted not as a collection of isolated topics but rather in relation to other standards. Making mathematical models is a Standard for Mathematical Practice, and specific modeling standards appear throughout the high school standards indicated by a star symbol ( $\hat{r}$ ) . |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

 analyzing them is appropriately a creative process. Like every such process, this depends on acquired expertise as well as creativity. Some examples of such situations might include:

- Estimating how much water and food is needed for emergency relief in a devastated city of 3 million people, and how it might be distributed.
- Planning a table tennis tournament for 7 players at a club with 4 tables, where each player plays against each other player.
- Designing the layout of the stalls in a school fair so as to raise as much money as possible.
- Analyzing stopping distance for a car.
- Modeling savings account balance, bacterial colony growth, or investment growth.
- Engaging in critical path analysis, e.g., applied to turnaround of an aircraft at an airport
- Analyzing risk in situations such as extreme sports, pandemics, and terrorism.
- Relating population statistics to individual predictions.

3

 summarized in the diagram. It involves
(1) identifying variables in the situation and selecting those that represent essential features
(2) formulating a model by creating and selecting geometric, graphical, tabular, algebraic, or statistical representations that describe relationships between the variables,
3) analyzing and performing operations on these relationships to draw conclusions,
(4) interpreting the results of the mathematics in terms of the original situation,
(5) validating the conclusions by comparing them with the situation, and then either improving the model or, if is acceptable,
(6) reporting on the conclusions and the reasoning behind them. Choices, assumptions, and approximations are present throughout this cycle.

 way as computer algebra systems allow them to experiment with algebraic phenomena.

## Connections to Equations

Arizona College and Career Ready Standards - Mathematics - High School Placemats

## Congruence G-CO

A. Experiment with transformations in the plane

G-CO.A.1. Know precise definitions of angle, circle, perpendicular line, parallel line, and line segment, based on the undefined notions of point, line, distance along a line, and distance around a circular arc.
G-CO.A.2. Represent transformations in the plane using, e.g., transparencies and geometry software; describe ransformations as functions that take points in the plane as inputs and give other points as outputs. Compare
 ions that carry it onto itself
G-CO.A.4. Develop definitions of rotations, reflections, and translations in terms of angles, circles, perpendicular lines, parallel lines, and line segments.
. A.5. Given a geometric figure and a rotation, reflection, or translation, draw the transformed figure using, e.g., graph another.
B. Understand congruence in terms of rigid motions

G-CO.B.6. Use geometric descriptions of rigid motions to transform figures and to predict the effect of a given rigid motion on a given figure; given two figures, use the definition of congruence in terms of rigid motions to decide if they are congruent.
G-CO.B.7. Use the definition of congruence in terms of rigid motions to show that two triangles are congruent if and only if corresponding pairs of sides and corresponding pairs of angles are congruent
G-CO.B.8. Explain how the criteria for triangle congruence (ASA, SAS, and SSS) follow from the definition of congruence C. Prove geometric theorems

G-CO.C.9. Prove theorems about lines and angles. Theorems include: vertical angles are congruent; when a transversal crosses parallel lines, alternate interior angles are congruent and corresponding angles are congruent; points on a perpendicular bisector of a line segment are exactly those equidistant from the segment's endpoints.
G-CO.C.10. Prove theorems about triangles. Theorems include: measures of interior angles of a triangle sum to $180^{\circ}$; base angles of isosceles triangles are congruent; the segment joining midpoints of two sides of a triangle is parallel to the third side and half the length; the medians of a triangle meet at a point
G-CO.C.11. Prove theorems about parallelograms. Theorems include: opposite sides are congruent, opposite angles are congruent, the diagonals of a parallelogram bisect each other, and conversely, rectangles are parallelograms with
congruent diagonals.
G-0.D. 12 Manstruction
G-CO.D.12. Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.). Copying a segment; copying an angle; bisecting a
segment; bisecting an angle; constructing perpendicular lines, including the perpendicular bisector of a line segment; and constructing a line parallel to a given line through a point not on the line.
G-CO.D.13. Construct an equilateral triangle, a square, and a regular hexagon inscribed in a circle
Similarity, Right Triangles, and Trigonometry G-SRT
A. Understand similarity in terms of similarity transformations

G-SRT.A.1. Verify experimentally the properties of dilations given by a center and a scale factor
a. Dilation takes a line not passing through the center of the dilation to a parallel line, and leaves a line passing through the center unchanged.
b. The dilation of a line segment is longer or shorter in the ratio given by the scale factor

G-SRT.A.2. Given two figures, use the definition of similarity in terms of similarity transformations to decide if they are similar; explain using similarity transformations the meaning of similarity for triangles as the equality of all corresponding pairs of angles and the proportionality of all corresponding pairs of sides,
G-SRT.A.3. Use the properties of similarity transformations to establish the AA criterion for two triangles to be similar.
B. Prove theorems involving similarity

G-SRT.B.4. Prove theorems about triangles. Theorems include: a line parallel to one side of a triangle divides the other two proportionally, and conversely; the Pythagorean Theorem proved using triangle similarity.
figures.
C. Define trigonometric ratios and solve problems involving right triangle

G-SRT.C.6. Understand that by similarity, side ratios in right triangles are properties of the angles in the triangle, leading to definitions of trigonometric ratios for acute angles.
G-SRT.C.7. Explain and use the relationship between the sine and cosine of complementary angles
G-SRT.C.8. Use trigonometric ratios and the Pythagorean Theorem to solve right triangles in applied problems. $\star$

Arizona Department of Education
erpendicular to the opposite side
G-SRT.D.10. (+) Prove the Laws of Sines and Cosines and use them to solve problems
G-SRT.D.11. (+) Understand and apply the Law of Sines and the Law of Cosines to find unknown measurements in right and non-right triangles (e.g., surveying problems, resultant forces)

## Circles G-C

Understand and apply theorems about circle
Prove that all circles are similar.
G-C.A.2. Identify and describe relationships among inscribed angles, radii, and chords. Include the relationship between central, inscribed, and circumscribed angles; inscribed angles on a diameter are right angles; the radius of a circle is .

G-C.A.4. (+) Construct a tangent line from a point outside a given circle to the circle
B. Find arc lengths and areas of sectors of circles
5. Derive using similarity the fact that the length of the arc intercepted by an angle is proportional to the radius, and define the radian measure of the angle as the constant of proportionality; derive the formula for the area of a sector.
Expressing Geometric Properties with Equations G-GPE
. Translate between the geometric description and the equation for a conic section
G-GPE.A.1. Derive the equation of a circle of given center and radius using the Pythagorean Theorem; complete the G-GPE A 2 Derive the anuation of a parabola given a focus and directix
G-GPE.A.3. (+) Derive the equations of ellipses and hyperbolas given the foci, using the fact that the sum or difference of distances from the foci is constant
. Use coordinates to prove simple geometric theorems algebraically
G-GPE.B.4. Use coordinates to prove simple geometric theorems algebraically. For example, prove or disprove that a figure defined by four given points in the coordinate plane is a rectangle; prove or disprove that the point (1, 그) lies on the circle centered at the origin and containing the point $(0,2)$.
G-GPE.B.5. Prove the slope criteria for parallel and perpendicular lines and use them to solve geometric problems (e.g. find the equation of a line parallel or perpendicular to a given line that passes through a given point).
G-GPE.B.6. Find the point on a directed line segment between two given points that partitions the segment in a given ratio G-GPE.B.7. Use coordinates to compute perimeters of polygons and areas of triangles and rectangles, e.g., using the
distance formula $\star$ distance formula. $\star$

## Geometric Measurement and Dimension G-GMD

G-GMD.A.1. Give an informal argument for the formulas for the circumference of a circle, area of a circle, volume of a cylinder, pyramid, and cone. Use dissection arguments, Cavalieri's principle, and informal limit arguments.
G-GMD.A.2. (+) Give an informal argument using Cavalieri's principle for the formulas for the volume of a sphere and other solid figures.
G-GMD.A.3. Use volume formulas for cylinders, pyramids, cones, and spheres to solve problems. $\star$
B. Visualize relationships between two-dimensional and three dimensional objects

G-GMD.B.4. Identify the shapes of two-dimensional cross-sections of three dimensional objects, and identify threedimensional objects generated by rotations of two-dimensional objects.

## Modeling with Geometry G-MG

Apply geometric concepts in modeling situations
G-MG.A.1. Use geometric shapes, their measures, and their properties to describe objects (e.g., modeling a tree trunk or a MG A 2 Apply conder). $\star$
-M.A.2. Apic
G-MG per cubic foot). $\star$
tric methods to solve design problems (e.g., designing an object or structure to satisfy physica constraints or minimize cost; working with typographic grid systems based on ratios). $\star$

## Arizona College and Career Ready Standards - Mathematics - High School Placemats

Interpreting Categorical and Quantitative Data S-ID
A. Summarize, represent, and interpret data on a single count or measurement variable

S-ID.A.1. Represent data with plots on the real number line (dot plots, histograms, and box plots)
S-ID.A.2. Use statistics appropriate to the shape of the data distribution to compare center (median, mean) and spread (interquartile range, standard deviation) of two or more different data sets.
S-ID.A.3. Interpret differences in shape, center, and spread in the context of the data sets, accounting for possible effects of extreme data points (outliers).
S-ID.A.4. Use the mean and standard deviation of a data set to fit it to a normal distribution and to estimate population percentages. Recognize that there are data sets for which such a procedure is not appropriate. Use calculators, spreadsheets, and tables to estimate areas under the normal curve
B. Summarize, represent, and interpret data on two categorical and quantitative variables

S-ID.B.5. Summarize categorical data for two categories in two-way frequency tables. Interpret relative frequencies in the context of the data (including joint, marginal, and conditional relative frequencies). Recognize possible associations and trends in the data
S-ID.B.6. Represent data on two quantitative variables on a scatter plot, and describe how the variables are
a. Fit a function to the data; use functions fitted to data to solve problems in the context of the data. Use given functions or chooses a function suggested by the context. Emphasize linear, quadratic, and exponential models.
b. Informally assess the fit of a function by plotting and analyzing residuals
c. Fit a linear function for a scatter plot that suggests a linear association.
C. Interpret linear model

S-ID.C.7. Interpret the slope (rate of change) and the intercept (constant term) of a linear model in the context of he data.
S-ID.C.8. Compute (using technology) and interpret the correlation coefficient of a linear fit.
S-ID.C.9. Distinguish between correlation and causation
Making Inferences and Justifying Conclusions S-IC
A. Understand and evaluate random processes underlying statistical experiments

S-IC.A.1. Understand statistics as a process for making inferences about population parameters based on a random sample from that population.
S-IC.A.2. Decide if a specified model is consistent with results from a given data-generating process, e.g., using simulation. For example, a model says a spinning coin will fall heads up with probability 0.5 . Would a result of 5 tails in a row cause you to question the model?
B. Make inferences and justify conclusions from sample surveys, experiments, and observational studies

S-IC.B.3. Recognize the purposes of and differences among sample surveys, experiments, and observationa studies; explain how randomization relates to each.
S-IC.B.4. Use data from a sample survey to estimate a population mean or proportion; develop a margin of error through the use of simulation models for random sampling
S-IC.B.5. Use data from a randomized experiment to compare two treatments; use simulations to decide if differences between parameters are significant.
S-IC.B.6. Evaluate reports based on data

## Conditional Probability and the Rules of Probability S-CP <br> Conditional Probability and the Rules of Probability S-CP

S-CP.A.1. Describe events as subsets of a sample space (the set of outcomes) using characteristics (or c-CP.A.1. Describe events as subsets of a sample space (the set of outcomes) using characteristics (or outcomes, or as unions, intersections, or complements of other events ("or," "and," "not"), S-CP.A.2. Understand that two events $A$ and $B$ are independent if the probability of $A$ and $B$ occurring together is the product of their probabilities, and use this characterization to determine if they are independent.
S-CP.A.3. Understand the conditional probability of $A$ given $B$ as $P(A$ and $B) / P(B)$, and interpret independence of $A$ and $B$ as saying that the conditional probability of $A$ given $B$ is the same as the probability of $A$, and the conditional probability of $B$ given $A$ is the same as the probability of $B$
S-CP.A.4. Construct and interpret two-way frequency tables of data when two categories are associated with each object being classified. Use the two-way table as a sample space to decide if events are independent and to approximate conditional probabilities. For example, collect data from a random sample of students in your school on their favorite subject among math, science, and English. Estimate the probability that a randomly selected

 They are not only immersed in interesting mathematics but are actively engaged in the "doing" of mathematics. Mathematics is not a bystander sport.

 role in the high school curriculum as possible pathways for those students who seek meaningful $4^{\text {th }}$ credit courses that connect to technology and the needs of the $21^{\text {st }}$ century learner.
 problems related to paths, circuits, or the relationship among a set of objects

## Connections to Modeling

 7 players at a club with 4 tables, where each player plays against each other player or 2 ) engaging in critical path analysis, e.g., applied to turnaround of an aircraft at an airport.

## Discrete Mathematics (CM-DM) 太

A. Understand and apply vertex-edge graph topics

AZ.HS.CM-DM.1. Study the following topics related to vertex-edge graphs: Euler circuits, Hamilton circuits, the Travelling Salesperson Problem (TSP), minimum weight spanning trees, shortest paths, vertex coloring, and adjacency matrices.

AZ.HS.CM-DM.2. Understand, analyze, and apply vertex-edge graphs to model and solve problems related to paths, circuits, networks, and relationships among a finite number of elements, in realworld and abstract settings.

AZ.HS.CM-DM.3. Devise, analyze, and apply algorithms for solving vertex-edge graph problems.
AZ.HS.CM-DM.4. Extend work with adjacency matrices for graphs, such as interpreting row sums and using the nth power of the adjacency matrix to count paths of length $n$ in a graph.
